Not higher peaks, but fills in the valleys to give a higher average power. Basically it compresses the peaks and amplifies the valleys . The RF peaks will not be over 100 watts if therig is rated at 100 watts

Compression does not drive the voice to "higher" peaks. It merely raises or fills the valleys between your voice peaks. This may be a poor analogy, but it is the best I can think of at the moment.

Check the photos and pictures in the various handbooks.

I use about 10-12 percent of compression with my voice. Too much compression causes distortion, splatter and nasty comments from users of adjacent frequencies.

25964. MH-36 vs MH-59

Yahoo group: FT897 (2009)
Date: 2009-05-07 16:01:55 UTC
From: tenorman1952
Topic: 25964 Message: 25964

NOW I finally have an answer to my frustration with the MH-36.

From Yaesu's Tech Support:

Paul:
If I am understanding what you are saying the difference between the MH-36 and the MH-59 mics is the MH-36 really only adds DTMF feature over the stock MH-31Mic. The MH-59 gives you full control of the radio. You can input frequencies, scan up and down, DTMF, and program the P keys. You are right tat there are no instructions for the MH-59 or 36 in the Operating Manual. If you wish, I can send you instructions for the MH-59 which are found in the FT-897's sister radio the FT-857.

73
Tim Factor, KT7F
Amateur Radio Technical Support
Vertex Standard USA, Inc.

This finally tells me what no one else did... the MH-36 does not provide the functions I was expecting. Unfortunately, there are no instructions explaining that (about the MH-36), or it would have saved a lot of wasted time.

I just bought an MH-59. It will do everything except scratch your back
for you.

The instructions for its use are in a separate PDF file, an an
Addendum to the Manual. It may be available from Yaesu, but I know fur
sure it's available from a ham who posted it to the Internet, at:

http://jan.kepic.cz/_storage_/Yaesu-MH-59A8J-Manual.pdf

If you buy the mike, be sure to look at the resources available on the
Internet to fix two separate problems that the MH-59 suffers from.

1. RFI. The mike is susceptible to an RFI problem, so that when it's
keyed, RF gets into the mike circuit and keeps the PTT circuit
"closed," and the rig continues to transmit even when you release the
PTT button. The immediate short-term fix is to unplug the mike, but
that's obviously not a permanent solution. The problem can be fixed
by putting a small toroid into the mike and wrapping the mike leads
one turn through the toroid. see:

http://www.ae7q.net/doc/public/MH-59.php

for details. If that doesn't fix the problem, check your coax cables
for poorly connected shielding at one or the other of the connectors.
If you do this carefully, it's probably reversible without visible
effects, and thus wouldn't void the warranty.

2. Crummy audio (insufficient lows). For this fix, see:

http://members.cox.net/w1aex/mh59.html

Warning. "Step Two" of this mod involves soldering small capacitors
onto the circuit board in the mike, and probably will void the warranty.

Pull the rubber ring off the know and see if it has a set screw. If so, loosen it and pull the know forward a bit.

I can't remember how th eknow is held on. But a hard bump to the face of the radio could (well, probably would) drive it back on the shaft too far.

There is rubber around the knob. This comes off and there is a set screw that is used to adjust/tighten the knob. It is a metric size (which escapes me right now) so a standard allen key will not work.

You can pick up some nice small sets of allen wrenches at Radio Shack. They have a "ball end", which allows you to use the wrench at a slight angle.

They come in both inch and metric sets.

They are all out of mertic sets.

You may be making it more complicated than necessary. The FT-897 (as well as the FT-857 and FT-817) all come with a simple microphone--the MH-31. It has no touchtone pad. The only thing the MH-36 gives you is a keypad, so you can enter tones. It's really just an MH-31 with a keypad added. The MH-59 is the super whammy whiz bang model that also will do remote control functions on the FT-857 and FT-897. By the way, I think it's pretty "stinko" of Yaesu to not include the MH-36 as the standard microphone, instead of the MH-31, or at least give you an option to get the touchtone model instead of the plain jane model by just paying the differential.

From: patecq
Topic: 25967 Message: 25975

thanks to the 897 group.
a blade screwdriver can easily work off the main dial rubber grip.
i did have a metric hex that fit the screw at the bottom and lets the big knob come off.
there is a circular spring that wraps around a thread shaft coming out of the radio. how far the spring is screwed onto the shaft determined the tension of spinning knob.
the fall out of the van brought the spring closer to the front which gave it too much play.
works fine now. thanks

Any company has to base the selling price on its costs and anticipated profits
and on the effect of price on sales. A higher price means fewer sales.
Yaesu made this decision when they chose to include the MH-31.
In fact, the price you pay for the MH-36 or the MH-59 is "the differential".
If they had included the MH-36 and added $50 to the price, would you have bought the radio at the higher price?

I would have preferred that they included the MH-59, charged the higher price,
and saved me the hassle, time, and postage of ordering the mic. Nothing in their advertising prepared me for the uselessness of the MH-36. I would have preferred just to get the best combination and be charged at the beginning, and avoid all that extra ordering time.

Not exactly. Yaesu is not taking your original mic and giving you a discount equal to their cost on the old mic. You are paying the full retail price (as determined by the market) for the MH-36, MH-59, or other accessory.

Gigaparts lists the selling price of the MH-59 as $82.00 today. If Yaesu elected to make it the standard mic included with the ft-857/897 the cost to Yaesu would not go up $82.00 for each radio. It is even possible due to an increase in the number of MH-59s Yaesu is manufacturing, the cost per unit might go down.

Pat, I can't follow your logic here. Yaesu's cost would go up by its "wholesale" cost of the MH-59, minus the wholesale cost of the MH-31.

Let's say, for the sake of discussion, that Yaesu's cost to manufacture each mike is half the retail cost. So its added cost would be $41 minus $16 (assuming $32 retail value for the MH-31, or $25. If they made the MH-59 standard, they would not bear the cost of making an MH-31 to put into the 897 box.

Again, assuming for discussion's sake that they are doubling the manufacturing cost to arrive at a retail price, that would mean they would add about $50 to the cost of the FT-897 if they sold it with the MH-59 as the standard mike.

A more rational and customer-friendly approach by Vertex-Standard would be to offer the rig with either mike, your choice, with an added price for the MH-59.

I think that Lew's analysis is right on.
And, is consistent with what I was trying to say.

The cost that you face is NOT the cost of Yaesu to manufacture.
In between you and Yaesu are a bunch of people who are entitled
to make a profit.

So, if Yaesu were to bundle the MH-59 with the radio, you would likely
see that the cost of the radio would go up to the current retail cost plus
the retail cost of the MH-16. You might save a few dollars due to the
"differential" but not very much.

By your logic, Yaesu should just bundle every possible accessory
with the FT-897D. This would just not make sense.

I am sure that a lot of FT-897D owners use the MH-16 and find it
sufficient for their needs. You can do everything you need through the
front panel, and many people can not afford or do not want to spend
extra for the better microphone.

Yaesu attempts to satisfy all markets by throwing a gazillion features
into the base unit and providing an optional set of accessories.

What they give you for the money is quite good.
I did a lot of comparison shopping and found that FT-897D to
give the best set of features for the money.

Let's say, for the sake of discussion, that Yaesu's cost to
manufacture each mike is half the retail cost. So its added cost would
be $41 minus $16 (assuming $32 retail value for the MH-31, or $25. If
they made the MH-59 standard, they would not bear the cost of making
an MH-31 to put into the 897 box.

Again, assuming for discussion's sake that they are doubling the
manufacturing cost to arrive at a retail price, that would mean they
would add about $50 to the cost of the FT-897 if they sold it with

the MH-59 as the standard mike.

A more rational and customer-friendly approach by Vertex-Standard would be to offer the rig with either mike, your choice, with an added price for the MH-59.

Pat, I can't follow your logic here. Yaesu's cost would go up by its "wholesale" cost of the MH-59, minus the wholesale cost of the MH-31.

Let's say, for the sake of discussion, that Yaesu's cost to manufacture each mike is half the retail cost. So its added cost would be $41 minus $16 (assuming $32 retail value for the MH-31, or $25. If they made the MH-59 standard, they would not bear the cost of making an MH-31 to put into the 897 box.

Again, assuming for discussion's sake that they are doubling the manufacturing cost to arrive at a retail price, that would mean they would add about $50 to the cost of the FT-897 if they sold it with the MH-59 as the standard mike.

A more rational and customer-friendly approach by Vertex-Standard would be to offer the rig with either mike, your choice, with an added price for the MH-59.

Did you notice the same audio issues (poor bottom end) as w1eax? Did you perform the mod with the caps, or were the mechanical modifications enough to fix the problems? Also, does it help to use the TX EQ settings built in to the radio?

I'm seriously thinking about getting the mic, myself. I mostly use the radio next to the computer, so I use CAT to change freqs, but it'd be nice to have a little more control on the radio itself (for example, I always set my power output to 5w while tuning after changing bands.. that's a pain from the front panel.)

Friends . . .

I think we have lost sight of the original posting which dealt with someone's concern that his new FT-897's meter was only showing 30 watts output on SSB. Somehow the discussion got sidetracked into theory and oscilloscopes.

A typical transceiver's output meter will INDICATE approximately 30 watts output for the typical human voice even though the rig itself is rated 100 watts PEP output. Assuming the use of a decent microphone, increasing the MIC gain beyond the ALC level indicated in the owner's manual will usually create distortion and IMD products.

That was all that several of us were attempting to explain to the original poster.

73,

Kent K9ZTV

I just got an FT-897 last week. I'm very disappointed by the fact that the squelch and RF-gain are on the same knob, and there's no provision for automatically switching modes when you change from SSB to AM/FM.

Personally, I wish the clarifier knob could be used for RF gain when in its "neutral" mode, so I could actually use it. As it is, I pretty much leave the knob in squelch mode, since I need it for repeater operation.

From: K.Greenough
Topic: 25956 Message: 25988

Hello Richard,
A halfwave will present a very high impedance to
your tuner, possibly too high for it to match [on
40m] whereas on 80m it would be a quarter wave
with relatively low impedance and your tuner
would have a much easier time matching up.
At 5 or 10 watts out of the 897 I doubt that any
mismatch would damage the PA.

I seriously doubt the manufacturing cost of the MH-59 is more than $10. I'm going to make some assumptions here: assume Yaesu's whole price is $40 and that 1/4 of FT-857 and FT-897 owners buy the microphone. If 1/4 of FT-897 owners buy the mic, we're looking at Yaesu making an extra $7.50 per radio sold. If they sell 100,000 radios, that's $7.5 *million* in extra revenue by not bundling the mic with the radio.

NOW do you see why they don't bundle the mic, even though we'd sure as heck like them to?

25992. Kenwood TL-922A and FT-897 amplifier problem in UK - and repair or service ctr?

Yahoo group: FT897 (2009)
Date: 2009-05-04 09:05:20 UTC
From: simon.worsley
Topic: 25992 Message: 25992

Gents,

Thanks for the bandwidth and apologies for being slightly off topic !!

My TL-922A on 80m with 30watt drive from my ft-897, the amplifier is producing 100 to 150watts LSB output on VOICE PEAKS. If i whistle its a lot more.

Is that the right sort of output for 30w lSb VOICE input to the amp?

I was speaking to a couple of UK stations yesterday evening, and they told me there is definitely something wrong with my amp as 30watts LSB voice overs should produce 350 to 400watts output on voice overs and a lot more on a whistle.

Please help?

Also does anyone know anyone in the UK where I can send the amp for testing and to have the noisy relay mod carried out?

Thanks for your help in advance!

73s. Simon UK

The actual difference in manufacturing cost is probably less than $5.
There's nothing special about that microphone from a manufacturing
standpoint: it's got fewer parts than a cheap push-button telephone, and I
can get a phone for $10 at Wal-Mart.

Yaesu includes DTMF control mics with all of the UHF/VHF radios, presumably
because you need the DTMF capability to control repeaters. Since this radio
is also repeater capable, don't we need that ability, too? If I didn't want
to work repeaters with this radio, I would have bought an FT-450 instead.

No, it's about getting an extra $80 out of us, pure and simple.

Not quite John,
It should leave the peaks at their present level but bring up the lower audio levels so that the average audio power is higher.

Isn?t the Compressor supposed to drive your voice to higher peaks?

25998. Making my own CT-62 from a USB port

Yahoo group: FT897 (2009)
Date: 2009-05-09 03:27:01 UTC
From: ka2ugz
Topic: 25998 Message: 25998

Hello all -

I am attempting to make a CAT cable from a USB-TTL serial port. I have used this before with non-Yaesu radios with success. The new laptops don't have 9-pin serial ports and I want to avoid the USB to serial port converter.

I am trying to determine what the proper logic levels are for TXD and RXD which I traced on the schematic to the processor. I am also unsure if a signal inversion is needed.

A pointer for the processor data sheet would help.

Thanks - Jay KA2UGZ

On my rig, the band just above the 6-meter band will receive WFM in the FM broadcast band. This is diagrammed in the "Operating Band Selection" section of the manual. In the circular graphic, the FM broadcast band is shown as 88MHz.

So to get there, you need to be using one of the VFOs, and press Band Up or Band Down as necessary to reach the band just above (in frequency) the 6-meter (50MHz) band. If necessary, change the mode to WFM.

Don't expect stereo! Or even high fidelity. But it's not bad sound.

This band uses the VHF/UHF antenna, not the HF antenna. So be sure you have an antenna of some sort connected to the VHF/UHF socket.

I think what your asking is to go straight from the logic of the USB chip to the radio interface skipping the RS232 level electronics all together.

Excellent Idea!

The CAT interface is simple TTL levels while the USB converter is *probably* 3.3v. But, I think that you may get away with it as a 5v spec is for TTL only. If inversion or a higher level is needed, one can use a simple xsistor to bring the level up or invert it. The radio shack scanner adapter may be all you need. It has a mini plug and is only 5v but you will have to figure out the logic of either inverting or non-inverting.

Unfortunately, I think you may be on your own trying to make this work. I would love to spend the time trying if I had it. Please report back top the group if you succeed please!

Hello there.
I am very sorry, but all of you are very wrong indeed. The actual manufacturing costs in mass manufacture are quite different. I went into this and contacted a few manufacturers in China. The actual cost of a 1 to 1 copy in China of the standard microphone would be only one dollar and 22 cents. The copy for the keyboard microphone would only be 8 cents more. This however would only apply to a minimum order of ca 20.000 units. So the cost difference to Yeasu would not affect the retail price of the Ft 897 at all. The manufacturing price in electronic components really has no relation to the final sales price. Just look at the prices on E-bay from the Hongkong suppliers.

I do believe that the reality is quite different. The company tries to make as much money as possible with the extras sold. This is of course quite normal, they are in the business to make money.

I seriously doubt the manufacturing cost of the MH-59 is more than $10. I'm

going to make some assumptions here: assume Yaesu's whole price is $40 and

that 1/4 of FT-857 and FT-897 owners buy the microphone. If 1/4 of FT-897

owners buy the mic, we're looking at Yaesu making an extra $7.50 per radio

sold. If they sell 100,000 radios, that's $7.5 *million* in extra revenue by

not bundling the mic with the radio.

NOW do you see why they don't bundle the mic, even though we'd sure as heck

like them to?

26003. Re: MH-36 vs MH-59

Yahoo group: FT897 (2009)
Date: 2009-05-09 08:30:42 UTC
From: dyarnes1
Topic: 25964 Message: 26003

You guys are making my head hurt! All I said was that Yaesu was kind of sticking it to us (well, actually just some of us)by not giving us a choice of microphones and charging an "appropriate" differential. In other words, if I would rather have the MH-36, charge me $20 more or so (that's the approximate difference in price for the two microphones at various dealers. Pat and Lew are sort of saying that same thing, although they are analyzing it a bit differently I think. Bruce's logic/argument sort of escapes me.

I think it's fairly obvious why Yaesu does what it does, although there is a little history to it as well. As someone else pointed out, For years rigs didn't come with any microphone! It was always an additional item. Then, some years ago, in an obvious marketing ploy, some manufacturers started including the microphone in the price. I doubt they really "gave" it to you free, and it was probably all considered in setting the price. After all, you really have no idea what the price would have been if they had opted to not include the microphone. But the fact that a microphone was included had the impact of making buyers think they were getting a better deal. However, in just about every case, the included microphone will be the "basic" model--no frills. For some that's just fine. The problem is that if the basic microphone isn't what you really want, you have to buy an upgraded microphone at "full" price rather than just swapping out and paying the difference. So, you end up with two microphones, one of which you don't use. In those situations, where's the benefit??? It's only those who don't want an upgraded microphone who benefit (or think they do--remember, it probably really isn't "free").

I'm somewhat cynical about just about any manufacturer's motives, but I also understand something about marketing strategy as well. I believe most manufacturers have a "target" markup for any product, and it would be more or less the same (the markup) with or without the microphone. So I'm saying that you probably are "buying" the included microphone, and it has been marked up as well. Then, if you happen to be one of those buyers who really wants an upgraded microphone, you end up spending more! Simple, but effective marketing. The only time you really get something for "free", is when they run one of those special sales, and include some accessory not normally included. But that's another marketing ploy, usually when sales are waning a bit, and so they throw you a bone to keep sales up.

Anyway, this is all very hypothetical since we really don't even know what's being done to manipulate sales, what the markup is, or anything. My original comment was sort of tongue in cheek anyway, and I certainly wasn't being naive about the marketing aspects, or the business decisions behind them. However, that doesn't mean that I shouldn't feel like I got nicked a little extra because the microphone that came with the rig (which I "paid" for) was inadequate, forcing me to end up with two microphones. Kind of a waste! The bottom line though is that, as a consumer, you look at the price and decide if you want it bad enough to pay it.

Anybody need an MH-31 microphone???? I'll sell it to you for a reasonable price!

From: kc3vo@aol.com
Topic: 26004 Message: 26004

Yes, an average power or CW type meter WILL typically show only 30 watts or so from 100 watts of voice-modulated SSB, and this is perfectly NORMAL! The SSB power varies in step with your voice peaks, and the peaks are of short time duration, so a special meter, or an oscilloscope, is needed to accurately show the REAL maximum power. Do NOT attempt to adjust your radio to show more power, or you will cause distortion and possibly damage to the radio. A BIRD model 43P wattmeter with the 100 watt, 2 to 30 mhz slug, should accurately show you 100 watts, even though other average power meters will show 30-40 watts at the same time! If the radio shows 100 watts in CW and FM, it is operating OK.-73, KC3VO-Bob Curry

I simply switched to FM mode and dialed in the frequency. FM is received via the VHF/UHF antenna socket. Now when I change bands, it finds that frequency as a band between 6 meters and 2 meters.

But the stereo separation sucks.

Are you using it as a center fed dipole or end fed? You could feed it
14% off center and get matches on most of the bands.

From: Eric van de Weyer
Topic: 25298 Message: 26009

Hi everyone,

I turned my radio on this morning and found that, instead of getting nice pure tones when it beeps, such as when turning on, changing modes, bands etc. it now sounds like a rough CW tone with AC hum on it. Everything else seems to be working OK and it receives and transmits OK.

Has anyone else come across this before?

73....Eric VK2VE.

Hi Louis,
I can only assume you want to transmit on citizens band if you require 27 -28MHz FM, as far as I am aware there is no software for widebanding the 897D, only hardware mods, although it may be possible on an older 897.
I really have to ask, why would you want to Tx on those frequencies? Rather than risk losing your licence, would it not be easier to buy a citizens band radio?

With a 4:1 balun and feeding the antenna 14% off center you can get a
low VSWR on most bands without a tuner. I love my 80 meter off center
fed dipole bent around the house rain gutters.

From: Richard Corfield
Topic: 25956 Message: 26014

This sounds tempting for home use. To make the 4:1 it's twice as many turns on the secondary as the primary? I think the MFJ tuner has one built in.

On 5/9/09, Jim C <liteways@...> wrote:

Well done on the M0!

My 897 was software widebanded by the previous owner. I'd like to put it back.

I'd think old CB27/81 radios are cheap. I have one the wife would like
me to sell. I don't know what life 27/81 has with the eu frequencies i
think eventually replacing the old uk.

This has already been done. You can buy the cable on ebay for about $20 or here for a little more. http://www.g4zlp.co.uk/unified/YaesuCAT.shtml
I have one of these but got a new PC and am running Vista, which the cable driver does not support, so be sure if your using Vista to get one that has drivers for Vista.

Richard - I thought that they reverted as soon as you switched them off and back on if the widebanding was by software. That was the reason that the FCC leant on Yaesu to modify them so that they couldn't be opened up that way (as in the 897D). This has lead to us doing the hardware widebanding. Are you sure that yours hasn't been hardware widebanded which optionally could be done on the earlier models.

It might pay you to open yours up and check which combination of jumpers are in place or open.

Why bother taking the wide-band mod out of the set if
it is already there ??

It's only illegal to transmit out of band, so simply don't plan
on transmitting out of band and you are fine ...

thanks to the 897 group.
a blade screwdriver can easily work off the main dial rubber grip.
i did have a metric hex that fit the screw at the bottom and lets the big knob come off.
there is a circular spring that wraps around a thread shaft coming out of the radio. how far the spring is screwed onto the shaft determined the tension of spinning knob.
the fall out of the van brought the spring closer to the front which gave it too much play.
works fine now. thanks

As it appears that there is significant misunderstanding of the terms Peak Envelope Power, Mean Power and Carrier Power, and means of measurement of those terms, may I point people to VK1OD's web page on the subject. VK1OD explains the subject better than I and by simple pictures (of a Bird 4314) makes the difference between average power and peak power extremely clear.

I would recommend that everybody who is in the slightest way unclear of any part of the subject read

http://vk1od.net/measurement/SsbTxPower/MeasureSSBTxPower.htm

and I would suggest that the list owner place the web page in the files section of this group (after seeking VK1OD's permission of course).

The antenna for U/VHF needs to be plugged in... The other SO239.
Other than that dial in the frequency and go.

Also, weaker stations may not break the squelch.

I use the ATAS120 with the 857D in my truck. When you "tune" the antenna system you are inserting more or less of the inductor into the circuit and just like with a manual transmatch tuner you get maximum noise when the system is resonant.

Much better than I can, DK Johnson, W6AAQ describes the difference between adjusting your antenna system for resonance and using a tuner to adjust for a mismatch, in his book "Everything you forgot to ask about HF mobileering".

These screwdriver antennas like the ATAS and DKx series are designed to have a very high Q and they are not broad so getting them to resonance will improved received signals.

>

The software fix, which doesn't work on my radio, only changes the "jumper" settings (which are actually solder pads) on the mainboard. The radio reads the jumper settings when it's reset, and the software patch is supposed to change the in-memory version of those jumper settings.

According to what I've read, there is NO way to freeband the FT-897 to transmit in the 27 MHz range. If you want to transmit on 27 Mhz, you need to buy a CB radio.

Thanks for the replies. I was able to use my cable with HRD after I changed the Menu #20 to CAT.

The 3.3V signal swings appear to work, the driver I use is for the Prolific chip set under XP but I will keep your warning in mind if I ever move to Vista.

Buying a cable I can make just rubs me the wrong way... for some things I like to build/experiment/ponder my way through which is the great thing about this hobby there is always something else you can play with.

When you flip through the bands, you'll eventually hit a band that's somewhere close to the FM broadcast band. Then just use the VFO knob to tune in a radio station.

Folks,

We are heading to Dayton and will be in Booths 114-115. In addition to our W4RT Electronics products, including our Collins filters for Yaesu and ICOM radios, we will have Graham Somerville from bhi, Ltd. in our booths presenting their DSP products at Show Special pricing, and I will be there demonstrating the mRS miniVNA antenna analyzer.

As a result of the dollar's present strength with respect to the Euro, we have been able to buy a large lot of the miniVNAs at a favorable price. We will offer the miniVNA at the Dayton Hamvention at a VERY special price! This is a great instrument for those who work with antennas and other devices. Just hook up to your laptop and you can see any part of the spectrum from 100 kHz to 180 MHz. In real time, you can see at a glance where the antenna is resonant, and the SWR, return loss, impedance, phase, etc. as a function of frequency. The best (minimal) SWR frequency is automatically found and displayed.

Hope to see you at Dayton!

Barry W4WB and Ralph N5DOI

Info on the mod can be found at www.mods.dk <http://www.mods.dk/> but I think only the removal of the jumper is covered. That said, if you reverse the instructions for removal, you "theoretically" could replace the jumpers. Problem is, you would need the correct pieces to replace. Yaesu would have these and based on prior experience you would pay like 10 cents (give or take) per piece, AND you should have a very steady hand to solder them back in.

I think you'll find the shaft plugs into the encoder on these.

Certainly for 857's it's quite common to break the shaft which is available as a cheap service part, got to be the same thing in an 897, and I'm sure quite a few people hear have already done theirs.

thanks to the 897 group.
a blade screwdriver can easily work off the main dial rubber grip.
i did have a metric hex that fit the screw at the bottom and lets the
big knob come off.
there is a circular spring that wraps around a thread shaft coming out
of the radio. how far the spring is screwed onto the shaft determined
the tension of spinning knob.
the fall out of the van brought the spring closer to the front which
gave it too much play.
works fine now. thanks

Info on the mod can be found at www.mods.dk <http://www.mods. dk/> but I think only the removal of the jumper is covered. That said, if you reverse the instructions for removal, you "theoretically" could replace the jumpers. Problem is, you would need the correct pieces to replace. Yaesu would have these and based on prior experience you would pay like 10 cents (give or take) per piece, AND you should have a very steady hand to solder them back in.

True. The driver provided by Prolific for their chipset provides the software to have the USB cable look like a standard COM port. HRD had no trouble with it.

My FT897D is also less than three months old (manufactured 11/2008). Maybe the store that sold you yours went in and removed the zerohms in advance or possibly the build for the US market is different? You can see them clearly on page 10 of this PDF.

http://www.rigpix.com/yaesu/ft857-897_modcollection.pdf

Just in case you have any doubt the Yaesu technical supplement shows them on the assembly drawings and even gives them part numbers! Look for JP1001 etc. (RMC1/16 000JATP)

When I did the modifications I actually had to desolder and move them to get the desired coverage.

A short length of desoldering braid was the order of the day for cleaning up the connections after the zerohms had been removed.

It is true that sufficient solder can easily bridge the extra pads though.

Anybody wanting to broadband the Tx on the 897 and
having the right to Tx out of amateur bands should note
that the output filters could present a very bad match
when well away from amateur frequencies and damage
to the PA is likely. The only reason I can think of to justify
widebanding is when the 897 is being used to drive
microwave transverters. Very low power is generated in
the transverter mode and would be quite safe.

The filters are low pass, and switched according to frequency, the match is likely to be acceptable at most frequencies.

Also it is necessary to wide band the radio to access the UK 5MHz frequencies, and 40m above 7.1 in some older models.

Got to be careful here I think.

The same was true with the IC756PRO but operation on 5MHz resulted in the 80m filter being selected, consequentially the transmitted frequency was in the stop band.

Has anyone modelled the output low pass filters to determine the cut off frequencies and verified which one is selected as the frequency changes?

Widebanding is useful if you want to use the rig as a signal generator.

Ken -

The problem allude to is most notable when making the broadband mod to Icoms.

Those who use Icoms (706 specifically) were advised that there would be a problem (such as you mention) when broadbanding the rig for use on the MARS frequencies. The Yaesu rigs seem to be much more tolerant when modified for services such as Military Affiliated Radio Service.

I know that many love their 706 rigs, but this is what came down the local MARS network.

FTR - mine is a European model. As delivered - plain vanilla - the jumper set up was :

1007 Blank
1008 Jump
1009 Blank
1004 Blank
1005 Blank
1006 Jump
1001 Jump
1002 Jump
1003 Blank

After you do any re-arranging of the jumpers, you will need to reset you radio.

With the radio switched off, hold F & V/M and turn ON.

Disclaimer - you do mods on your radio at your risk - this was true for mine. I did the MARS mod satisfactorily. YMMV.

I recommend, good light preferably with a magnifier, an anti static wrist band, a needle point iron and a very steady hand.

It may mean the product has reached its sales peek and sales are now falling away.

When they first released these, there would be orders large enough to do a production run where the smt zero ohm links were placed by the production line pick n place machines as a production run for each country. However if the market falls away as I expect it has by now, production would probably move to making all boards the same and manually making the mods for each country during the handle assembly and test procedures.

On a pick n place assembly line it's easy to place zero ohm resistor links, but not easy to set the solder paste so it will form a solder blob, the total converse being true for hand assembly.

Yaesu often use the same boards in radio's for other bodies like military, air etc. I'm not sure about the 857 / 897 boards, but plenty of other Yaesu boards turn up in other kit that looks identical but just has different software, you even have the Vx7r handy being released as is with a change of the screen print and software and sold for VHF air use. Early UK military air fields were using Vx7r's wide banded even though they were not approved. So it seems Yaesu commonly make a radio board designed for wide band use then limit it by software which makes good sense, spend the time and effort to design a good chassis then sell it in every area possible to recoup that investment, but it also means you can invest more in the first place because the market is greater. It is possible however in some kit that filters are manually adjusted for each chosen application, and may need readjusting for other bands.

I can say though I have been using an 857 and a 767 as a test source within an anechoic chamber, wide banded, used at full power, all modes across it's whole range and have not had any problems with it. I am also aware however of one guy that tried to use his on 466 GPRS/FRS bands and suffered from filter problems, one would however expect things to be much tighter in the UHF area than at HF. The simplest test to be sure is to hook up a good power meter, Tx on FM or CW, on known close ham bands, check that power, then move to the unknown band and Tx again, if the power has fallen off you are probably cooking a filter stage.

It is also advisable to check AMPERAGE draw, if operating outside amateur bands! If the current drawn for rated output power is noticeably different, (by over 10% or so) it is likely that you are operating in the danger zone! Be careful, be legal, and good DX!--73, KC3VO-Bob Curry

Hello All
Here in Ireland, our FM Broadcast band is 88-108 MHz
The mode is WFM, wide FM, this is easily explained, as bandwidth for music, must be much greater than Bandwidth for the human voice.
On My FT897D, when I select FM Broadcast, the auto setting is WFM,,,I cannot change the mode !!! ,, I have tried on both the 897D, and 857, and both are the same... My radios are both the European model. ???

Geoff, that was a superb reference...many thanks!
I have been following this thread with great interest and I am willing to openly admit that I also was one of those licensed hams who was always confused by all of these confusing terms and concepts involving average and peak power. VK1OD's explanation is the FIRST one I have ever seen that explains and illustrates the material and the theory in a very straight forward and easy to understand manner. Thank the heavens for that! :)
All too often we hams are somewhat hesitant to admit that we aren't as knowledgable about some of the ideas and principles involved in the varied technical aspects of our radio hobby as wethink we should be. Thankss to fellow hobbiest such as yourself and some others in this group we all can benefit from continuing our technical understanding of that "magic" underlying our hobby!
Thanks Geoff!

As it appears that there is significant misunderstanding of the terms Peak Envelope Power, Mean Power and Carrier Power, and means of measurement of those terms, may I point people to VK1OD's web page on the subject. VK1OD explains the subject better than I and by simple pictures (of a Bird 4314) makes the difference between average power and peak power extremely clear.

I would recommend that everybody who is in the slightest way unclear of any part of the subject read

http://vk1od. net/measurement/ SsbTxPower/ MeasureSSBTxPowe r.htm

and I would suggest that the list owner place the web page in the files section of this group (after seeking VK1OD's permission of course).

26059. Collins filter--and more

Yahoo group: FT897 (2009)
Date: 2009-05-14 01:02:35 UTC
From: willgord
Topic: 26059 Message: 26059

I am still fairly new to the 897D but certainly pleased with the rig. Operating with a Superantenna inside a New York City apartment building, I have worked some 40 countries and 30 U.S. states.

Now, I would appreciate having some of you veterans answer a couple of questions.

What would I be gaining by adding the Collins SSB filter? What exactly goes it do and how well does it do it?

At some point I will probably want to upgrade to something better. By that I mean a rig with more features to help me get my signal out under difficult conditions. I can't ever hope to put up an outdoor antenna. As I say, I work with a superantenna mounted inside the apartment, and a counterpoise for 20 meters hanging out the window.

Does anyone have any thoughts on 897 vs 950, for instance? What would the 950 offer thatr the 897 doesn't? What rig would I have to get to make a real difference in transmitting and receiving? Would a 950 do it or would I need to go to a 2000?

All thoughts are welcome.

First, you mention 'getting a "better" rig to help get my signal out'. That, my friend, is the job of the antenna, NOT the radio. The radio generates the RF, the antenna distributes it into radio waves. Maybe you need a better antenna, not a better rig (and maybe a better place to live - sorry, but apartments suck - I live in one too!).

As far as the filter goes, I don't use one, don't see a need for one, but I will leave the technicals to someone else who knows more about them.

Well done on the contacts you have. I've found with homebrew antennas
and a small garden (or even a moderately sized campsite while
respecting other campers) getting out on HF can be hard work.

I don't notice the 2.3kHz filter. I'm new to this but others here have
said the same.

The 500 for CW and digi modes does make a difference.

I like the filters. There is not much difference from the speaker but I can tell with headphones on. What really works great for the 897 is the DSP addition. (see W4RT web site). I have a number of 897's and I had them install the DCP in all of the radios....there you see a difference in noise.

As far as getting better trasmit from a radio, lets face it 100 watts is 100 watts no matter what radio you use. Think about the antenna or maybe an amp.

You can modify the transmit frequeny response with DSP (limited),
filter and choice of mic. This may help you make more addicient use of
power. I think you carrier the carrier point in advanced menus to tune
the filtering.

Someone, possibly here, said the antenna was 95% of it.

Hi,
RE 950 vs 897D

I own both rigs and the biggest difference you will find is that the FT-950 has a better rcvr than the FT-897D. As far as transmit goes, yes, you might be able to tweak the TX-mic EQ on the 950 a bit and get just a TAD more punch to the TX audio but like it was said, the antenna is the weak link in this situation.

IMHO The 950 and 2000 are fairly equal as far basic RX and TX capabilities go. Others might disagree.

Just a suggestion, but why not get out and enjoy the features of the 897? Pick up the a set of internal batteries and a mini-G5RV that you can string up in the park with bungie cords or another suitable portable antenna and use the portablilty of the 897 with battery packs to get a signal out from a picnic table. The 20w output on internal batteries combined with a decent portable outdoor antenna and the upswing in the sunspot cycle should be enough to get you working the world, as they say. If you've had success with the SuperAntenna working from inside your apartment, imaging the fun you'd have with it set up on a portable mast in the park that you can break down and carry around in a bag the size of a laptop bag. I had the pleasure of picking up a wide band (500 kz to 1300 mhz depending on configuration) military surplus antenna a few years back that is fairly easy to setup and mates with the 897 & tuner perfectly for portable picnic table ops, which the 897 is a perfect rig for. At under 50w, it still qualifies for most, if not all, QRP contests and the all of the people i've chatted with always take a break in the pile up to handle that 'QRP Station' or 'Mobile unit'. Even if you dont feel comfy in Central Park, there's a NY State Park that overlooks West Point that I've been too during a couple VHF contests that was very 'ham friendly' and not too far out of the city. Its been a long time, so i cant remember the name, but it would probably be a nice break from the city hustle and bustle to day-trip it out there and work a few new ones...

Just a suggestion, like I said, portable ops aren't for everybody, but its another facet of our hobby that alot of people enjoy and the 'big guns' always seem to help out when they hear them...

73 and good luck

Hello all...Last night I was using HRD + DM780 4.1 Beta...I went to make a call...and the PTT came on on the Signalink USB...But no TX. I then X'd out of HRD and DM 780 and switched to USB on 20M, went to appropriate Freq., and pressed PTT on my mike. No TX. I tried different bands and modes, no TX. I tried the tune button on my LDG AT-897, no TX. I did a CPU reset...twice. No TX. Then, out of nowhere, I pushed PTT on the mike and it started working again. Made several PSK31 QSO's after that with no problem. Everything is fine now. Any Ideas??? Thanks.

I do have a battery for the 897 and am only a block from Central Park. The superantennas breaks up into small pieces for easy transport. I will take the rig to the park, clamp the antenna to a park bench and see how will I do running 20 watts.

A big reason for picking the 897 over the 450 or even the 950, was being able to operate portably. I had no idea how well I would do, with an antenna inside the apartment. My fall back would be working in the park and seeing if I could at least operate there.

I have done so much better than I hoped from inside the apartment that I haven't worked up the energy to move outdoors, but will do so.

Thanks much for the encouragement.

> Just a suggestion, but why not get out and enjoy the features of the 897? Pick up the a set of internal batteries and a mini-G5RV that you can string up in the park with bungie cords or another suitable portable antenna and use the portablilty of the 897 with battery packs to get a signal out from a picnic table. The 20w output on internal batteries ... (trimmed)

Why limit yourself to just 20w? I have one of those "Husky Power Center" things that jump start your car, has a 110 vac inverter, air to pump up your tires, makes cappucino, etc. I opened it up, have a pigtail coming out directly from the gel battery inside with an Anderson Powerpole connector. I have an extra 10 ga power cable for my 897, unplug the FP-30 supply's plug, plug in the power cable which also has Powerpole on the other end. Voila! On a full charge I can operate at the full 100w setting for about 2 hours. By that time voltage on transmit falls to about 11.3 v. BUT the radio does not cut off, and it still transmits.

With my portable antenna, a homebrew Buddipole up about 22', in the park I made QSO's from southern Louisiana to Iowa, Michigan, Wisconsin, Pennsylvania, Maryland (Assateague Island, he was also portable, sitting on the beach with his FT-897), New York, and more. Lot's of 59's and 57's. I suppose it works.

Jetstream makes a nice dipole hanger. This makes it very easy to make a quick dipole.

http://www.jetstream-usa.com/jtce1.shtml

http://www.jetstream-usa.com/instructions/jtce1.pdf

You could also bolt it to a plastic cutting board (won't be brittle in cold weather like plexiglass), with a series of holes on the edges, making a good multiband "fan" dipole. A 500' roll of insulated 14 ga stranded wire can be bought at Home Depot for just $25.00. Some parachute cord, buy the bright orange for visiblity, and tent stakes. A quick antenna there.

Also, for a 1:1 choke balun, rather than a big coil of coax, on my 50' sections of RG-8X I have, on recommendation of Palomar Engineers, 5 FSB-1/4 snap on ferrite beads. I left about 1/4" between them so that they still coil up easily. Also, I have heat shrink tubing on each to keep them from snapping open and getting lost. I used good Amphenol PL-259's on each end of the coax. I keep two of these 50' feedlines in my portable kit.

In my AE5JU folder in the Photos section, my portable setup. Now, is that fun or what? A very pleasant day! A number of people came over to see what we were doing. A good opportunity to pass out fliers for upcoming ham classes and test session.

Paul

Hey Joe.....

Unfortunately, the head is not removable on the 897D, therefore...no remote kit.

The FT-857D DOES have the removable head and there is a remote kit for it.

I just traded my 897D for an 857D so I would have the remote operation! Perhaps you could do the same. (Just make sure you trade for a later model 857D so you get the TCXO which is standard in the later 857D's.)

Jim,
To the left of where the bar graph is you will see one or two plus signs. On plus is 10 over and two plusses is 20 over.

Heh. some NUMBERS on the meter would be good, wouldn't they? It's pointless
to use it as an SWR or output power meter if there are no numbers on it.

Reports of 20 0ver 9 and even 40 over 9 shown on
some S meters are a joke. If a station was running ,
say 10 watts, and he's S9, and he changes aerial or
increases power and the meter shows that he's now
30 over 9 that means his power has increased from
10 watts to 10,000 watts. Not very likely..

Hi everyone,

I turned my radio on this morning and found that, instead of getting nice
pure tones when it beeps, such as when turning on, changing modes, bands etc. it now sounds like a rough CW tone with AC hum on it. Everything else
seems to be working OK and it receives and transmits OK.

Has anyone else come across this before?

73....Eric VK2VE.

Greetings to all,

I just purchased an FT-897D, still haven't taken it out of the box yet. I also ordered two batteries (not here yet) and a Buddipole antenna (not here yet). I already have a TS-2000 (home rig w/ G5RV) and IC-706Mk2g (mobil rig, not yet installed, but will be soon). My intent is to use the new 897 for portable operations (field day, trips to beach, trips to mountaintop, hikes, etc).

I have some questions about the new setup:

Will the batteries charge if they are in the radio and 12V is supplied from an external power supply? Is a CD-24 necessary? If you get a CD-24, do you need a PA-26?

For those who've used a Buddipole, is an antenna tuner necessary or recommended? For those who do use a tuner, what do you recommend? Anyone used the LDG 897 specific model?

I'm looking forward to making some contacts portable. Next problem to solve will be logging. Normally I am a huge fan of computer logging, but not sure I will always have my laptop with me (there is only so much weight you can take when hiking to mountaintop). I'm thinking in the cases when the laptop is left behind I will just do paper logs. But I'd be interested if anyone has any other ideas.

Thanks.

Can't speak definetively to your charging questions since I don't have my stuff here. My recollection is that you have to charge with the CD-24. You can supply 12vdc to the CD-24 with a Molex plug from your car or buy a PD-26 or equivalent for home charging. I'm 95% positive that there is no internal charging system in the FT-897/D. I use a 14 watt portable solar panel (Northern Tools) with a homebrewed cable to charge my batteries with the CD-24 on the run. Have not run any tests on it to determine 0-full charge time as of yet.

On your tuner question, the AT897 is FAR superior to the FC-30 from Yaesu. I've had both and sent the FC-30 back within 7 days. LDG's customer service is fantastic if you have any issues. The first one I got was bad and they cross shipped a new one out based on my description of the problem on the phone.

Hi Chip. You'll really enjoy the FT-897D. Regarding the Buddipole, it's best, as with any antenna, to tune the BP to resonance on the band you're using, and not use a tuner. If you don't already have one, an antenna analyzer of some sort would be a great investment for this application. Also, if you haven't already, you'll want to join the Buddipole Users Group, at http://groups.yahoo.com/group/Buddipole/ Budd (the creator of the Buddipole), and his son Chris (owner of the company) are active on this group, and very responsive to questions and comments.

Enjoy!

Ken,

Hi Chris-N1MIE,
I have read your last three posts, regarding the FT-897D and the Buddipole antenna. I was in the same boat about 15 months ago when I bought an FT-897 (not D) with two batteries but alas, no charger! I quickly discovered that the unit would not charge the batteries when in the radio and powered by an external 13.8 volt source. The Yaesu CD-24 seemed too expensive, but when you consider what all it does, as I found out later, the price is in line with the product. I opted to purchase a universal, solid state controlled unit from Batteryspace.Com. I runs the charging voltage up to 16.5 volts and when detects slight drop in voltage, when the battery is fully charged, it supplies a trickle voltage of 15.5 volts.
Also I had a Yaesu FC-20 antenna tuner for my FT-847 transceiver, which had a very limited range, and I purchased a LDG AT-100 Pro. The LDG antenna tuner was a full two lengths ahead of the Yaesu unit. Of course if you already have a manual turner, it will be just fine, If you want a nice tuner for the FT-897D, LDG makes a good wide range too.
It not fully automatic, say push and hold one button, but it comes with all the necessary cables. The W4RT site has goodies for the FT-897 as well.
About 2 months after the purchase of the used FT-897, I got the Super Antenna MP-! for portable use. It is a vertical and you need to put out a counterpoise for it, so deciding I did not want to get into stringing out the wires for the counterpoise, I picked up a gently used Buddipole Deluxe, with some extra pieces an another Hamfest, figuring to use it as a dipole or dipole variations, and not have to mess with counterpoises. So having a shortened antenna with narrow tuning ranges, needed an antenna analyzer, like the MFG-259B to tune- up the Buddipole. Do you see where I am going with this? HI HI

I have enjoyed making bits and pieces for the Buddipole system out of schedule 80 PVC, like adapters, guying connectors out of couplings and many various adapters for 2 and 3 element beams. The PVC machines well, that is drilling and tapping (threading) and also modifying adapters to also take the standard 3/8-24 threaded parts for mobile whips, picking up studs and couplings at Hamfests. The Buddipole is very well made and of course very versatile.
The internal batteries, in the FT-897, are very nice but limited as to any long term operation, so I added a 33 Amp-Hr, SLA lead acid battery to the "portable" operation as well.
My plan is to operate PSK 31, which now, we add a Laptop too.
I am almost sorry I sold my 10 year old pick-up truck, perhaps an ATV with a trailer? If you want, I will give you my e-mail address, and we can swap stories and experiences.

After a few responses I'm seeing the writing on the wall. So I've added more expense to the setup and ordered a CD-24 and PA-26. Those should be here before the week closes out (ordered at an accelerated rate). Buddipole arrived today. Now just need the batts and the charger (I'm pretty sure that I read that you need either the charged batteries or the internal power supply to run the radio).

Given that I've already forked out $1,680+ on the setup, I think I'm going to skip the tuner for now. I've been studying up on the Buddipole on it's group, and it sounds like I can get it where I need it with the equipment I already have. I already have an antenna analyzer which I can use to setup the Buddipole for field operations. I will later look at adding a tuner for long-wire operations.

Thanks for the suggestion. I joined the group and have started reading and inquiring there regarding my new (just received, not used yet) antenna.

I wasn't sure what you meant by your first sentence at first. But I think I have the idea now. I will use my antenna analyzer to adjust the Buddipole until I have it set for whatever band I'm going to operate on. I'm looking forward to taking a trip to Mount Misery this coming weekend (assuming all parts are in play by then) for some operations.

Any advantage of this over the CD-24?

When it's time, I will get an LDG. But not right now.

I thought it was a fairly complete system, what more do you need to
make? I will be supplying my own tripod, I have three or four which
will suit that I purchased for antenna purposes (I also use them to
deploy VHF/UHF antennas for ARES events).

> The internal batteries, in the FT-897, are very nice but limited as

How long do folks typically get at various power levels? (Obviously
will depend on tx/rx ratios.)

> My plan is to operate PSK 31, which now, we add a Laptop too. I am
> almost sorry I sold my 10 year old pick-up truck, perhaps an ATV

ATVs are not permitted in my local state parks. So I will limit to
hiking or mountain biking abilities. Of course I can also pack up in
my Dodge Ram 1500 when needed and access a lot of great places. So
there will be various scenarios in play. One thing I don't plan (at
this time) is portable operation on foot (while still walking).

26096. Question about using HRD and 897d squellching during tuning

Yahoo group: FT897 (2009)
Date: 2009-05-19 14:58:37 UTC
From: wa0lhb_john
Topic: 26096 Message: 26096

Hi,
While using HRD to operate on the HF bands everything works as I would expect except the audio is briefly squelched on each tuning step as I drag the tuning button across the frequencies.

Is this normal for HRD and the 897?

My FT-950 doesn't have this malady while tuning.

I searched the list but probably didn't use the right key words... at any rate I have the Baud set to 9600 with DTS set and have tried various settings for critical menu settings with no help.

Thanks for any insights.

I have noticed the same effect. It might be worth downloading FTBCAT from http://www.g4hfq.co.uk/download.html and see if it does the same thing.

There has been some talk on the HRD forums about this, too. It makes it impossible to use the Band Scope as well...

From: Paul Graham
Topic: 26096 Message: 26098

Hello,

Two days ago my 897D flickered off and came back on without me touching anything (at least I don't think I touched anything). On inspection it turns out that the radio had done a full reset. I don't think there was a power outage as the lights didn't flicker. The radio seems to be working properly now.

Has anyone else had this happen to them?

Thanks,

Paul.

Hi, my name is Ken, KF7COO, in Mt. Just acquired a general license and am just getting started in ham radio. My first purchase for a base radio is the FT897D, it looks very well made and will probably be all the radio I'll ever need. I bought a Yaesu VX177 last year and am totally impressed with the quality of that... it looks and feels like its almost bulletproof! So far I've only bought the bare radio.... don't have a pwr supply, batteries, antenna... nothing. I'm hoping to get some good advice and sources from those of you who are way more knowlegable than I am. Maybe one day soon I'll be able to help someone out too. Glad to be here,

Ken

No, I haven't had this happen before. I had to do a hard reset after I installed the two optional filters and batteries. I don't think the intallation had much to do with it. The radio blew the fuse in the DC car plug because the fuse was not big enough for the radio and my auto squelch on VHF/UHF didn't work after that and the radio had slipped into emergency mode. I had to find the menu for that and turn OFF the emergency mode and eventually did a hard reset. Now that I have the batteries installed, if I do lose power, the batteries seemlessly take over withough any problems.

Hi guys

I am a soon to be ft-897 owner (as soon as UPS get here on Thursday!)
anyway my question is what would be a good choice for an external battery that I can use for portable operations? I would like to operate at 50 to 70 watts or so.

Also how many hours do think I can get on external battery power figuring that I will be listening allot more than talking?

Thanks, KI4HSK

I use a sealed lead acid battery designed for electric carts. The battery is a 12V 12Ah unit. The battery is a CSB unit, item code EVX12120F2.

Note that a standard car battery is _not_ a good choice since it's not designed for deep discharge use whereas a cart battery is.

You can easily obtain a deep cycle unit over the web or eBay.

I charge my unit using a solar charger which puts current in at about 0.7A in bright sunlight.

The working time depends on the transmit duty cycle of course. I would reckon on a few hours maximum on full charge. With my solar charger (and assuming decent sunshine!) I hope to operate pretty much all day on and off.

I use a pair of PowerSonic PS121000 AGM batteries to power my shack during power failures. They are maintained, when the grid is up, by a 45A linear PS through a West Mountain Radio Super PWRGate. The WMR unit is a 3-stage AGM charger and also acts as a transfer switch when the grid goes down. For extended grid outages, I can connect the 2 X 64 watt PV panels on my pickup into the battery bank in the shack.

You can see the PV panels on the pickup in action at:
http://wedothatradio.wordpress.com/2008/04/11/green-radio-we-do-that/

I run an 897D, a 2800M, a scanner and a laptop off my 12 VDC buss so that if the power goes out in the middle of a WX net, I've still got radar, two area repeaters and public service comms.

Remember when calculating your estimated runtime that you don't want to draw the batteries below 50% charge. Anything over that will seriously shorten the battery life.

Cliff is right about not using a standard car battery. Another reason for not using a flooded cell battery is that they outgas hydrogen (highly explosive) and sulfuric acid fumes (highly corrosive). You don't want either substance inside your shack.

Mouser currently has the PowerSonic batteries in stock for $290/ea. Last time I checked http://www.dcbattery.com/ was out of the PowerSonic units but had a Full River equivalent for about $285/ea delivered to Texas.

I agree with Cliff. A golf cart battery is not a bad choice. Definitely don't mess with a regular car battery: a gel cell, golf cart battery or an RV battery is designed for the kind of use you'll put yours through. Starter batteries are designed for large, short bursts of power. Deep cycle batteries are designed for long, slow discharges.

The key to battery life is really 2 things: your power consumption and the battery's capacity. You can only estimate your power consumption by guessing how much you'll use the radio, but if you figure an average of 15 amps while transmitting voice (20 for digital) and 1 amp while receiving. 1 amp-hour is a draw of 1 amp over one hour. (That's at full power.) Make a wild guess of a 10:1 ratio: 10 minutes listening for 1 minute talking. With that ratio, you will probably draw 16 Ah over an hour period. The larger jump-start packs, at 18-20 Ah, would then be good for an hour under those conditions. Your typical RV battery at 200 Ah would be good for around 10 hours.

Yahoo group: FT897 (2009)
Date: 2009-05-19 22:11:43 UTC
From: Richard Corfield
Topic: 26101 Message: 26106

My first response to this was sealed lead acid or similar. Gel cells sound interesting.

I took my 897 out on a RAYNET duty using an old but hopefuly good condition NiMH 4Ah battery pack. Mostly listening with some transmit on 5 or 10W FM. I reckon it did about 6 or so hours of this before suddently failing, which is typical behaviour of NiMH. I had two battery packs with me so switched over and did the whole day's outing with ease.

I don't know if the 897 has any power saving features when on internal battery packs. I thought it did things like shut down the audio stages when not in use. That was obvious on mine on headphones before its repair but is not obvious now. Current draw with squelch closed I'm guessing from my meter is just under 1A. That's fairly big in comparison with some of the QRP radios and kits out there that draw less. Transmit pulls up to 10A, mostly around 4 to 8A at the powers I use.

Depending on what you're going to do, you'll at least need an antenna and power supply.

For an antenna, the choices vary widely: you can do anything from monoband dipoles and multi-band dipoles to vertical antennas. You can make inter-continental contacts on either: I witnessed a kid make a contact to Poland last night on a vertical.

For power, choices also vary, but the brand I keep hearing as the best is Astron. You can never over-buy in the power department; I'd suggest getting a 35-40 watt power supply. The radio peaks at 22 amps, and you can probably run it from a smaller supply, the difference in price is not really worth going without a radio because your power supply puked.

You can do something like the Hustler 5 or 6 band vertical for around $150-200, or you can go with a higher-class antenna for around $300-400. However, if you have the room, a multi-band dipole might be the way to go. A fan dipole has a separate wire for each band, and they're not too pricey... the only catch is that you need space to lay it out and attach it to your end points.

For 2M and 440 use, you can either get a fancy dual-band dipole, a simple ground plane antenna, or go to Radio Shack and get their $26 scanner antenna. I've been using one of those for years, and it's done a great job. My antenna mast is a piece of 3/4" PVC stuck in the end of a flag holder.

The best and smartest thing, though, is to find a local amateur radio club. I found a great group around here; the guys are very helpful, and most of their advice actually works!

Admittedly not a documented testimony, but for years I've been using regular auto batteries in my trailers rather than the deep cycle variety. Started after I
got one year out of a Diehard deep cycle battery in a travel trailer. I get 4 or
five years out of the regular car batteries (6 out of the latest, it has just now
failed) and none of them have failed as quick as the Diehard deep cycle battery did.
I don't wilderness camp, which is where I'd expect to benefit from a properly
working deep cycle battery.

I agree with some of the other posters, that the AGM batteries are probably best. I have two of them.

After having bought some duds, I now only buy directly from a local battery distributer. That seems to be the most effective way to find a FRESH battery. Avoid the battery surplus market.

Keep your new batteries on FLOAT chargers. These are designed to continuously maintain a full charge on your batteries. For lead-acid type batteries, this will both give the battery a long life (if it is in good condition to start with), and it will be fully charged when needed.

Find out what your local emergency groups use for battery connectors. Check with your club or local ARES group. In my area, we use Anderson Powerpole connectors. I have wires with powerpoles connected to the batteries. There are fuses on these for safety. I also re-terminated my float chargers with the powerpoles, which makes swapping batteries quick and easy.

The LDG AT-897 works great, and is highly recommended by nearly all who use it, even over the Yaesu tuner.

oops. yup. powering a 22 amp radio with a 40 watt power supply would be a work of magic. :)

Yes, you want a 35-40 AMP power supply. :) Personally, I like a lot of headroom for 2 reasons: the power supply usually stays cooler, and not running at its max output will probably help it to last longer. Of course, I've only had 1 power supply fail on me over the years, and it was an 8 amp supply that was feeding a radio that only needed 2 amps, so go figure.

One thing I noticed is that Radio Shack is clearing out their 25 amp switching power supply; I grabbed one at $60 to have on hand.

Thomas, I'm gonna take a bit of issue with your math here. I think you forgot to apply the actual percentages of the duty cycle.

Let's work with the actual numbers from the manual for this example. According to Yaesu, the FT-897D draws 1A on receive and 22A on full power transmit. We'll assume a duty cycle of 90% receive and 10% transmit, which is probably close unless you're net control.

Therefore, in one hour the radio will draw:

Receive 1A X 0.9 hour = 0.9 Ah

+

Transmit 22A X 0.1 hour = 2.2 Ah

=

Total 3.1 Ah

Under those conditions, a 20 Ah battery will last (drawn to 50% charge) for just over three hours, while a 200 Ah battery (also drawn to 50% charge) will power the radio for 32.25 hours. The batteries will last longer if the draw is not continuous.

BTW, the radio draws only 600 mA in squelched status, so you'll save a little bit of battery capacity if you're working in that mode.

Hello Ken and welcome to the group! Congratulations on your General license as well!
You've come to the right place for all kinds of advice (and opinions!) about the 897D.
Seriously, this group has been an exceptional spot for me as well as many others to learn as much as we can about the basics, intricacies and "hidden aspects" of the 897 rig.
Be sure to check out the files section of this group as well. There is a wealth of material there including operator's manuals, tips about using the menus, questions concerning batteries, swr questions ,antenna pointers, etc. Lots of great files that make for some interesting reading...especially while you are waiting for that UPS truck to arrive!
Personally I have mt 897 set up using the internal power supply. Currently I only transmit on the twenty meter band feeding my rig into a "Par Electronics End-Fed Monoband Antenna". So far so good. I find the internal power supply works flawlessly. Although some members of the group here have mentioned that some of the earliest models of the internal power unit were a bit noisy, those being produced now seem to have been cured of that problem.
The nice thing about the 897D is the fact that it also can be a great grab and go rig! The battery option is a really nice feature to have as well.
Great option for camping trips, field day operations, you name it!
Anyway, like I said Ken, welcome to the group!
'73!

Subject: [FT897] New member intro;

Hi, my name is Ken, KF7COO, in Mt. Just acquired a general license and am just getting started in ham radio. My first purchase for a base radio is the FT897D, it looks very well made and will probably be all the radio I'll ever need. I bought a Yaesu VX177 last year and am totally impressed with the quality of that... it looks and feels like its almost bulletproof! So far I've only bought the bare radio.... don't have a pwr supply, batteries, antenna... nothing. I'm hoping to get some good advice and sources from those of you who are way more knowlegable than I am. Maybe one day soon I'll be able to help someone out too. Glad to be here,

Ken

26117. Radio Control Cables

Yahoo group: FT897 (2009)
Date: 2009-05-20 13:03:47 UTC
From: rbfh1
Topic: 26117 Message: 26117

I'm using Airlink Express to get on the air with PSK-31 on my FT-897. My problem is having the AirLink Express program read the frequency of the radio and what band it's tuned to. My question is: Can I use the same cable that I use to program the FT-897 with my laptop for use as a radio control cable. The programing cable is a 6 pin DIN to a serial connector and then an adapter with a serial to USB connection. The cable works fine as a programming cable, but I didn't know if the control cables have different pin outs. I would also appreciate any help with the communication parameters. I think they should be 1 start bit, 8 bits per byte, 2 stop bits, and no parity. If anybody is using Airlink Express with their FT-897 and has it up and running with the program displaying freq and band, please help. Dave N9XHL

26118. Re: New to the group and the 897 and need external battery advice

Yahoo group: FT897 (2009)

From: ve3wmb
Topic: 26101 Message: 26118

There has been some good advice on this topic already posted.

Sealed Lead Acid is the way to go. I use both an 18ah Battery Booster Pack and a 32ah SLA designed for a motorized wheel chair, depending on how long I want to operate for.

Investing in a decent Smart Charger for SLAs is also a good idea.

Another thought is why not consider dropping your TX power to about 25 watts, and focusing on putting up a better antenna? (The difference between 25w and 50w is only about 1/2 an S-unit.) I have found that 25w on SSB will net you a lot of contacts with no issues.

This will cut your current consumption on transmit. I suggest using something like a DK9SQ mast to support a 44 foot or 88 foot doublet as an inverted vee, fed with TV Twinlead or ladder line to an auto-tuner. This will allow you to work multi-bands with a decent signal and will allow your antenna setup location to be independant of mother nature providing conveniently located trees as antenna supports. I have found that 5 foot flexible yellow fiberglass driveway markers (they have a plastic stake at the bottom and can be shoved in with your foot) make great end supports for a light inverted vee as they keep the ends of the wire off the ground and away from kids and pets and they are highly visible so that people don't run into them (important if you setup in a public space like a park).

Also as someone else suggested, only plan to use half of the capacity of the battery. Frequently discharging below 50% will shorten the life of an SLA battery. Also remember that at 10.5v an SLA is fully discharged, never drain it below this level or you will do damage to the battery.

Best of luck

Michael VE3WMB

From: robert goodman
Topic: 26119 Message: 26119

Selling two AR2 Communications High Performance Inline Rf Switched Amateur Preamplifiers:

SP144VDG for 144-148 MHz and SP432VDG for 420-450 MHz. Both are GaAsFET with about 15-16 db of gain. These made all the difference in really hearing the Amsat birds with my HT and my FT-897D and FT-857D ☐ and if you can't hear them, you can't work them.

http://www.advancedreceiver.com/page7.html for manufacturer details.

Price for both: $189. Price includes shipping. Both have BNC connectors, are in great shape and working with no known problems.

These are almost never available used ☐ so grab these if you can.

73,

Robert

Yes, the same cable performs both tasks: programming and computer control.

I believe my serial port config is 38400,n,8,1 (no parity, 8 data bits, 1 stop bit.) You can change the radio's CAT port speed from the menu.

I haven't used Airlink Express, but Ham Radio Deluxe works very well with my 897 (especially after I re-worked the button layout.. the default layout made no sense.)

Subj:[FT897] FS: Inline RF Switched Preamps ? Really HEAR the Satellites on 144 / 435

Selling two AR2 Communications High Performance Inline Rf Switched Amateur Preamplifiers:

SP144VDG for 144-148 MHz and SP432VDG for 420-450 MHz. Both are GaAsFET with about 15-16 db of gain. These made all the difference in really hearing the Amsat birds with my HT and my FT-897D and FT-857D ? and if you can't hear them, you can't work them.

http://www.advancedreceiver.com/page7.html for manufacturer details.

Price for both: $189. Price includes shipping. Both have BNC connectors, are in great shape and working with no known problems.

These are almost never available used ? so grab these if you can.

73,

Robert

I have ordered the data to sound card cable for the 897 via eBay (which should be here anyday) and need to know if HRD will work through the sound card or do I need the USB/SERIAL cable?

Yes, the same cable performs both tasks: programming and computer control.

I believe my serial port config is 38400,n,8,1 (no parity, 8 data bits, 1 stop bit.) You can change the radio's CAT port speed from the menu.

I haven't used Airlink Express, but Ham Radio Deluxe works very well with my 897 (especially after I re-worked the button layout.. the default layout made no sense.)

From: Thomas Wilson
Topic: 26117 Message: 26123

It's a good idea to have the USB to Serial adapter, but it's not necessary with this radio. The radio has a digital VOX mode, so it can start transmitting whenever you send it audio from the computer. Just make sure to mute the mic and line inputs in the Windows mixer (on the output side.)

If you're using Vista, you have to go in to Control panel->Hardware and Sound->Sound, then double-click the "Speakers" device. Go to the Levels tab and mute the line in and microphone.
In Windows XP: Control Panel->Sounds and Audio Devices->Advanced (in the Device Volume tab). Mute Line In and Microphone.

After that, you can select the input source directly inside Digital Master 480. You don't need to start Ham Radio Deluxe unless you're using a serial cable to control the rig through the 8-pin CAT port.

When I run this way, I put the radio in USB mode, not the digital modes. To transmit CW from DM480, you need to use the "MCW" mode, NOT the regular CW mode.

It's also a good idea to use a *dedicated* sound card for your radio. When I first connected my computer to my transceiver, I very quickly discovered why I needed a second interface: every time Windows made some noise, the noise went out through my transmitter. I also can't use the computer for music or video while the radio is connected to the sound card. By dedicating an interface to the radio, I eliminated this problem.

I use an Emu 0202 USB for my audio interface, but the Signalink USB provides an audio interface and an adapter cable in one package. You don't need a $100 sound card, though... I've successfully used the little USB audio adapter that comes with some Plantronics headsets, and I've used an external Sound Blaster. Just about any decent quality sound adapter should work, but you may need to play with it to get the audio levels right.

There's also the issue of isolation to consider: you can run in to some serious ground loop and RF issues if you plug the radio directly to the computer. As far as I can tell, the "Yaesu PSK Cable" available on EBay doesn't actually isolate the radio from the computer. When I first tried my home made cable, I couldn't transmit: it freaked the computer out, and the receive had a nice 60Hz hum - which really messed up trying to decode data. I solved the problem by using a ground loop isolation transformer: I plugged my homemade interface cable in to the transformer and then plugged the transformer in to the sound card.

The Signalink and the RigBlaster provide isolation internally, so that's not an issue with them.

26124. FS: Arrow Satellite Antenna - 10 Watt Duplexer for 146/437-10 & 146/437-10BP /

Yahoo group: FT897 (2009)
Date: 2009-05-21 03:40:50 UTC
From: robert goodman
Topic: 26124 Message: 26124

The Arrow Satellite Antenna got destroyed by high winds ☐ but managed to salvage the 10 Watt Duplexer for 146/437-10 & 146/437-10BP.

http://www.arrowantennas.com/ - for info on the Model 10W duplexer which sells for $59.

If you have the Arrow Satellite Antenna without the duplexer - or are trying to build your own, this one's available for $25 including shipping CONUS. It's weathered ☐ but works. It includes all the cables with BNC connectors. Note: this is JUST the duplexer and NOT the antenna.

Please contact direct via email.

73,

Robert AA5FR
http://AA5FR.com

PS: The Inline RF Switched Preamps are sold ☐ in less than six hours here on the Groups. Jump on this one if it meets your needs.

Great answer Gavin, Thank you very much!

I have a 12 channel audio mixer in the shack and when I get around to running all the rigs audio through that I'll also use the work around on the HRD WIKI page. I figured it had to be some strange software interface interaction between HRD and the rig since HRD works great with the FT-950.

John WA0LHB So much information.... so little time.

From: Niel Skousen
Topic: 26127 Message: 26127

Good Morning....

I'm rebuilding my ATAS100, and have just about destroyed the Base Matching unit... 8-(

So, I'm looking to buy a used Base Matching unit, or a complete ATAS100 / 120 ...

Please reply off list if you have a parts unit, or are interested in parting with a working used antenna

Thanks
Niel

Hi, Ken. Welcome.

I'm a fairly new General Class also, and use the 897 as a base rig and hope to use it at Field Day this year.

My setup is very simple: an LDG AT100-Pro tuner (same price as the Yaesu brand, and, from what others have said here, much better), and a Samlex 1223 power supply. The PS is only 23 amps, but that's all that I need. It's also only $100, is totally silent, has no rf hash, and is dead simple.

I agree with the others that additional "head room" supplied by a 35+ amp ps is nice, but I was looking for inexpensive and quiet. It's also the one my local radio shop sells lots of.

The tuner is good. I have an 80m dipole that works reasonably well, except that the tuner won't handle 160m at all. It works fine on receive, but the SWR is off the chart on Tx. It's up about 35 feet in an inverted V configuration.

Stay tuned to the group. You'll get lots of information and opinions.

Richard

> Hi, my name is Ken, KF7COO, in Mt. Just acquired a general license and am just getting started in ham radio. My first purchase for a base radio is the FT897D, it looks very well made and will probably be all the radio I'll ever need. I bought a Yaesu VX177 last year and am totally impressed with the quality of that... it looks and feels like its almost bulletproof! So far I've only bought the bare radio.... don't have a pwr supply, batteries, antenna... nothing. I'm hoping to get some good advice and sources from those of you who are way more knowlegable than I am. Maybe one day soon I'll be able to help someone out too. Glad to be here,

Topic: 26117 Message: 26131

It was the PSK interface cable from g4zlp which connects to the Data input and the sound card input. I will let you know if works tonight. If I can get EasyPal SSTV to work using the cable, I am going to download the HRD and try some PSK and RTTY also. That is the reason I got the interface. I want to get into the digital comms on HF. I don't have the ear for CW but I can type pretty well. Later, I will get the Signalink for connection to the USB.

No problem. Let us know how it works out.

Which cable did you buy? Can you post the auction number?

Thanks

From: Danny Loyd
Topic: 26099 Message: 26132

I got my General in December '08 and the FT897 was my first choice for my base because of the great reviews I read. I bought it via eBay and got the radio, AT897 tuner, internal power supply, two batteries, charger, and FT meter all for under $1000 so the price was right.

I have been trying new stuff on it all the time. We have a SSTV repeater here in our home QTH and I have used this radio with EasyPal using the computer microphone and speakers to send and receive. Now I am trying to get going on the digital modes. The 897 is a great radio. I am running it through a G5RV at the present that needs to be reworked if it ever quits raining here.

I hope to meet all of you on the air in some mode soon.

Subject: [FT897] Re: New member intro;

Hi, Ken. Welcome.

I'm a fairly new General Class also, and use the 897 as a base rig and hope to use it at Field Day this year.

My setup is very simple: an LDG AT100-Pro tuner (same price as the Yaesu brand, and, from what others have said here, much better), and a Samlex 1223 power supply. The PS is only 23 amps, but that's all that I need. It's also only $100, is totally silent, has no rf hash, and is dead simple.

I agree with the others that additional "head room" supplied by a 35+ amp ps is nice, but I was looking for inexpensive and quiet. It's also the one my local radio shop sells lots of.

The tuner is good. I have an 80m dipole that works reasonably well, except that the tuner won't handle 160m at all. It works fine on receive, but the SWR is off the chart on Tx. It's up about 35 feet in an inverted V configuration.

Stay tuned to the group. You'll get lots of information and opinions.

Richard

26133. Incompetent Operator

Yahoo group: FT897 (2009)
Date: 2009-05-22 22:36:54 UTC
From: C. Griffin
Topic: 26133 Message: 26133

Deep breath. Heavy sigh. I probably should wait to write this, but I am probably the most frustrated ham in the world today. If not then pretty darn close.

I decided today to take advantage of the beautiful weather to give my new portable setup a run in the back yard. I decided to cut the grass first so I wasn't wading through tall grass. That didn't work out so good as about 25% of the way through it tossed a belt. No spares on hand. Decided to pull up the portable operations and ignore the grass til Tuesday.

I pulled out my easy-up tent (not so easy when there is only one person, but doable). I pulled out a bridge table and a folding chair. I pulled out the new radio with freshly charged batteries. I pulled out the buddipole and the antenna analyzer (MFJ 259B). I hauled everything out into my backyard, moved clear of the G5RV (50'+), and set everything up. I put up the tent, table and chair first. Then I pulled out the Buddipole. I setup the tripod first, then put the mast on it (mostly retracted). Then I put on the versatee. Then I added the arms and then the coils. I put the red/green one on the left and the black/blue one on the right. I put the whips on and then put the taps on. I setup for 20m and carefully followed the sheet. I was confused by the dual taps since there is only one wire to plug into the coil, but I put the red on 4 and the green on 10 (I think it was 10, it was where the green stripe was). I wasn't sure why a tap that didn't connected to a wire should be connected, but the directions seemed to call for it, so I tried. I put the blue and black on their appropriate tap location. I then plugged the tap wire into the green and blue per the sheet. Then I connected the coax assembly and set it up with the velcro strap so as to not pull on the wires (strain relief). I put the red to red and the black to black. I then connected the SWR meter. This was in the dipole position (no knob kit installed, arms directly to versatee). I set the whips to the recommended lengths, carefully reading about counting the base of the whip as one of the lengths. Then I connected the tuner ... and had a 20+:1 SWR. I worked with it for awhile and eventually got a 2:1 SWR in the middle of the 20m band. So I got on the air. I set for 100 watts (but I don't think it was actually putting out that much, no watt meter to check, just the one on the radio which was peaking about mid-scale on my voice peaks). I had no tuner, and I don't think the radio has one built in, so I just went to work. I quickly noticed that the noise floor was pretty low and I could hear a ton of signals on 20m. Either the band was open or this hears a ton better than my G5RV. I was feeling optimistic. But as the afternoon drew on that quickly faded. No matter what I tried, no matter who I called, no matter how long I called CQ, I couldn't make a

single solitary contact. I tried from 15:15 local until 18:15 local almost continuously with no success. I made two Buddipole adjustments in that time, neither took very long, so that was nearly 3 full hours of operating with no contacts. The two adjustments were this. I took down the Buddipole and tried to tune it to 40m (pretty good SWR). I heard almost no one and couldn't get a contact to save my life. So then I pulled it back down and tried 20m again, but this time I set it up in a shallow V. Tuned it even better this time, achieved about 1.5:1 in mid band. Still no joy. I can rattle off nearly 100 stations I heard, many at 59 or greater. No one could hear me, or at least no one acknowledged me. I tried calling CQ and after a few minutes someone tuned over me and then proceeded to start calling CQ DX. Tell me that isn't irritating. I haven't tried the radio with the G5RV, it's brand new, why wouldn't it work? Dunno. That's the next step, but not now. Not tonight. Now I'm going to shower and take the wife out to dinner. I'm going to try not to think about ham radio for a few hours so my blood pressure can go back to normal. I'm certain there is a good explanation, and it probably involves the incompetent guy who was operating the station, but that doesn't make me feel any better.

Sorry for the vent guys. Will check mail after dinner for your thoughts. (I see I have a message from Budd already, I'll respond later.)

Thanks.

From: Steve Yates
Topic: 26133 Message: 26134

Hi Chip,

Sorry to hear about your frustrations.

When it comes to compact antennas for HF like the BuddiPole, it is very important to get it adjusted to resonance and a good match at the antenna rather then rely on a tuner at the rig. And no matter what the hype, a small, loaded horizontal dipole on 40m at a very low height is not going to be very efficient. However, good QSO's can still be had. Here in Texas it is hard to find anyone during the mid-day but around 5:00 or 6:00 PM local things pick up a lot. When the solar activity picks up the mid-day stuff (NVIS) on 40m will be pretty good.

It is sometimes okay to tune a coax fed antenna with a tuner at the rig when the SWR at the antenna is resonably low, like 3:1 or even 5:1 depending on the coax loss when matched, but not 20:1. The coax losses will multiply in this case and depending on how the antenna is tuned you may end up with just a couple of RF chokes on a stick!.

I wouldn't fault the rig yet. Half scale on the power meter with SSB is plenty (see all the previous discussions on measuring SSB power). Also, for most folks the TX SSB audio sounds much better with the MH-31 microphone switched to #2 on the back of the mic. I find that the SSB gain doesn't need to be more then about 60 and that the speech processor doesn't really help much on the FT-897D. Always adjust your SSB levels looking at the ALC. As long as you're getting some ALC deflection you are putting out maximum peak envelope power.

In regards to hearing but not being heard, here is an example. Any antenna inefficiency on your end will decrease all signals, noise and stations. Since most rigs have way more sensitivity then they really need on HF anyway poor antenna efficiency will not effect your ability to hear them. However, your signal will decrease on their end but their noise will not. Therefore, you may drop into the noise when you can still hear them just fine.

You may already have one but if not I firmly believe that every ham should have an ARRL Handbook for a reference. When I was a young, new ham I would find the answer to most of my questions there. On the Internet you really are just going to get a bunch of opinions, some good, some not.

26135. Working HRD and DM780 (I Think)

Yahoo group: FT897 (2009)
Date: 2009-05-23 03:09:42 UTC
From: danleeloyd1
Topic: 26135 Message: 26135

I have looked at the old posting concerning HRD and the accompanying digital software and am at a loss for an answer to my question.

Here is the question I have, I bought a cable to interface between my 897 and my PC. It connects to the data input on the radio and the microphone and speaker of the sound card on the PC. Will HRD run using this interface or do I need the CAT to USB cable to run the radio using HRD? ALso will the digital software run through this interface?

I want to run RTTY, PSK31 and other HF digital modes. I know the interface cable works good because I have already used it for SSTV using the EasyPal program.

If HRD and DM780 wont work using this connector, can anyone suggest a good digital software that will?

Thanks,

Danny Loyd

You don't need the CAT cable; you can use the digital VOX mode on the radio to transmit in any of the digital modes. I leave the radio in USB mode rather than use the radio's digital modes, and I do NOT use HRD to key the radio. I've had several PSK QSO's so far, and it works great. Just make sure to adjust the computer's audio out: you want the level justt below the point where the ALC kicks in.

From: ve3wmb
Topic: 26133 Message: 26137

Chip :

Don't give up.

It is hard to account for propagation. Conditions of late have not been great.

In my many years of experience with the Buddipole there are only a few things
that will foul you up.

1) a short, usually due to a mis-aligned tap that is touching a second winding
2) an open circuit, usually something broken
3) proximity to something metal that is detuning the antenna

BTW if you look at the tuning instructions you will see that the second tap on the coils is used for tuning on some of the bands (you only ever use one tap on each coil at a time), but you can leave the second tap on for ease of bandswitching.

1 & 3 often result in the inability to get a reasonable match

2 usually shows infinite SWR as part of the antenna isn't connected. You can diagnose this with an Ohm meter or some other means of testing continuity.

My suggestion is to try your setup in a park where it is in the clear.
Also keep in mind that on 40m this in the horizontal configuration this is going to be an NVIS antenna. If you are still having problems making contacts try making one of the arms vertical (i.e. L configuration).

I have made many contacts with the Buddipole using 5W or less, but keep in mind that it is a compromise antenna as it is loaded (quite heavily for 40m) and with the standard mast it is actually quite low to the ground for a dipole. These are trade-offs that allow the
antenna to be compact, light and easy to setup, yet still very usable.

Best of luck,

Michael VE3WMB / VA2NB

Steve, thanks for the explanation about antenna inefficiency making a Tx signal fade into someone else's noise. That makes perfect sense now that you say it, although I was dumbfounded before today. Being a new ham, I'm reading voraciously and one of the pieces I read in one of the ARRL books was something to the effect that if you can hear them then they can almost certainly hear you. I've found that not to be the case, since I can hear many more signals than can hear me. I'm still tweaking my antennas and need to get an FTL Meter and an MFJ 269 so I can really see what's going on.

Thanks again to you and all of the group who spend time helping us newbies.

Chip,

Try something a little different. Forget the dipole setup, and instead configure your Buddipole as a vertical, or like a Buddistick. The first problem I see in you setup is probably that you were expecting good results from an antenna that wasn't sufficiently high. With the band conditions like they are currently, an inefficient antenna really accentuates the bad conditions. A Buddipole only a few feet high off the ground is sending most of your signal pretty much straight up!

Verticals just plain work better at lower heights! I'd still raise it off the ground some if you can, but even a few feet can help. Lay out a bunch of radials--as many as you can. A few might work, but more is always better. If you can elevate the radials as well, you might only need just a few, and resonant ones would be best.

Now you are only dealing with one coil. Use the extra rod from the other side of the dipole to raise the coil even further. Adjust your SWR to as close to 1:1 as possible, even by just sliding the tap around on the same turn of the coil. 2:1 is O.K., but you should be able to get it even a bit lower. Your impedence at the feedpoint isn't going to be 50 ohms anyway, so 1:1 may not be achievable. I'd guess 1.5:1 would be a closer target unless you use a tuner. Make the top section as long as possible too. The adjustment should be to use less of the coil.

Try this arrangement, and let us know what your results are. I'm betting they will be much better, but the bands are poor, so it's hard to say for sure. I'm confident though, that you will be "radiating a more effective signal" using this setup.

If it makes you feel any better, I tried yesterday to talk to a friend in Seattle. We usually don't have much of a problem. Yesterday, however, he was barely readable. It's just conditions!

From: gkar2000
Topic: 26135 Message: 26140

Hi Danny,

You can work digital modes with the cable you have. Use the DIG VOX for keying. DM780 should work, but HRD is the rig control program and you will need the CAT cable for that to work. I have the FT-857D and follow this list because the rigs are so similar. I have used Hamscope, Digipan 2.0, PSK Deluxe, DM780, MultiPSK and FLDigi and others with the audio cable and DIGI VOX.

Digipan is probably one of the easiest to set up and use. MultiPsk has almost any mode you can think of, but user interface is a little cluttered. FLDigi is what I use most often now, lots of modes and a nice clean look. Try them all pick your favorite.

Thank you,

That is what I needed to know. The DM780 looks like one of the best digital programs and it priced just right. FREE!!.

Subject: Re: [FT897] Working HRD and DM780 (I Think)

You don't need the CAT cable; you can use the digital VOX mode on the radio
to transmit in any of the digital modes. I leave the radio in USB mode
rather than use the radio's digital modes, and I do NOT use HRD to key the
radio. I've had several PSK QSO's so far, and it works great. Just make sure
to adjust the computer's audio out: you want the level justt below the point
where the ALC kicks in.

Hello Everyone,

I am trying to hard switch an amp' and need to find two pins in the CAT/lin plug that will connect when the rig goes to TX.
And will carry 12v 200ma to activate relays.
This is to activate my relay sequencer for the masthead amp and 144mhz tx amplifier.
The Data socket is occupied with the fsk/jt6 interface.

From: Richard Corfield
Topic: 26150 Message: 26150

I thought BBC Radio 4 were transmitting classical music under their news programs at first. It's interesting to see mixing in FM though and I wonder what's happening. In the time domain FM shouldn't mix, but in the frequency domain with a different detector or do I need to think more about that?

If I tune to Radio 4 on 93.300 then I hear in the background Classic FM on 101.150 (give or take). If I tune to Radio 4 at 93.700 then Classic is gone.

Thanks

Rotate the SQL/RF knob in the opposite direction or try changing the setting in menu 80. Sounds like you are in RF attenuation and when you load the setting from the software it is activating the SQ, or perhaps the opposite.

One important thing that the manual does not say on that page is that the rig must be in CW or CWR mode for the beacon feature to work.

It will take some jiggling with antennas to find out. I don't think the FM Broadcast omnidirectional in the attic is connected at the moment after a problem with the diplexer it uses with the TV antenna, so our broadcast radio is working off the TV antenna and sees Radio 4 on that frequency as weak and Classic as reasonably weak.

The 897 is connected to my 2m/70cm colinear so gets a good signal.

The Par 10/20/40 is a good performer, and the radio doesn't matter, as it is "resonant" on all those bands without a tuner. However, remember that you would have to turn the power down on the 897, because that particular model is only rated at about 25 watts. I have had a lot of fun using the one I have, along with a QRP rig like the ATS-3, from motel rooms, etc. Ideally, I wish there was one that included 30 meters, but WARC bands present very difficult matching problems for multi-band operation.

All the Par EFHW's come with a matching unit so that a tuner is not required. Unfortunately, Par hasn't produced a multi-band version capable of higher power levels, and I didn't get a very encouraging response from them when I asked if one might be available anytime soon. Some folks apparently have made some modifications to various models, so as to use them on other than the specified band. I'm not sure what they did, since the matching network is band-specific, as is the antenna length itself. Seems to me if you are going to tinker with one in that fashion, you might as well "roll your own", and save the purchase price. There is a lot of EFHW info on the web, and you can get all the info you need to make one.

Hi Bob kc3vo,

Tnx for the reply.
Would be fine if only an amplifier to switch !
I have a masthead pre-amp to switch out before the vhf amplifier comes on. This is achieved with a sequence of relays that can only activate the vhf amp' after the mast-head amp is switched out of line. This requires a "connection" of two pins in the CAT/lin plug that can carry 13v x 200Ma without damaging anything [in the 897] when the ptt is activated.

The data plug already occupied by the interface for fsk/jt6

Maarten,

I have a 10-20-40 and like it pretty much. I mainly use it on 20m where it works very well. I don't work 40m much but have made some contacts. On 10m I don't know if it's just the bad conditions or because I mainly work in the late afternoon and evenings but I've never worked anybody and only rarely even hear anybody. One of the features I like about the 10-20-40 is that you can use it as a single bander on any band from 10-40 using a proper 1/2 wave wire. You must be sure to tune the antenna properly to get the best results. The use of a tuner is not recommended by the manufacturer, but I use one occasionally to touch up my SWR on 40m. The main point to remember is that this antenna is for QRP operation only! It is only rated for 25 watts continuous. It is also primarily designed for portable/temporary use. The End Fedz radiation pattern is supposed to be much like a dipole and can be deployed in many different fashions such as: a sloper, an inverted L, vertical, or horizontal. It is nice for portable op.s because it can be deployed with just one support, is very light, can be fed direcly into your radio and needs no radials or counterpoise. Just remember that it is a compromise antenna and don't expect miracles from it! That said, I have personnally worked from Lithuania to Japan SSB 20m from my QTH in SoCal USA with the antenna only 20 ft. in the air.

Hope this helps and hope to work you in future! 73

Bon jour Philippe. It is strongly recommended that you don't mess with the service menu on modern radios such as the 897. They are individually set up against a stable accurate 13.8 V supply. You would run the risk of seriously damaging your radio.

Topic: 26165 Message: 26165

If you want "More Power", buy an external RF power amplifier! Increasing power beyond normal by mis-aligning the radio will increase distortion and shorten the life of your radio! Have you utilized the proper "Peak-Reading" RF Wattmeter and 50 ohm dummy loads to determine the present power output? Using incorrect equipment may lead you to believe there is a problem when in reality, all is normal! SSB power must be measured with the proper equipment, or indications are very likely to falsely show lower than actual power. Power in FM and CW modes may be accurately measured with cheaper meters that will fail to properly show SSB or AM power. increasing power via "Readjusting" the radio will only give 2 or 3 db more power, hardly enough to make a significant difference! (increasing power by at least FOUR TIMES, or 6 db, is required to be really noticeable on distant contacts, and increasing it by at least TEN times is far better! For 2 meters, there are many amplifiers of 170 watts or more available, and there are amplifiers of 100 watts and above available fore 70 cm. Many companies make HF/50 mhz amplifiers in to 400 watt to 1,500 watt class. Obtain the desired amplifier, with a suitable good ANTENNA, and you will be able to RELIABLY make contacts, while avoiding damage to your radio, or distorted signals.--73, KC3VO, Bob Curry

Hi Paul

No problems with it. The only thing important is to adjust the TX level on the signalink properly to allow it to transmit without cutting your signal out. I have used it with HRD and works great on PSK and RTTY.

Also, don't discount the value of a good antenna. Adding 3dB of gain anywhere in your system will improve your performance (especially on receive), no matter where it is: better feedline, better antenna, better antenna position... putting up a good beam antenna can get you 8dB of forward gain.. that alone is like bumping up your radio's output to 250 watts.

It's been said that "a dB is a dB", which means that a 1dB boost in performance is no different if it comes from your antenna, baluns, feedline, tuner, connectors, or grounding system. That's not QUITE true. The antenna and feedline system are much more important than your output power, since that's where your signal comes in... You'll get the best results if you make your improvements at the antenna first, then work your way back. :)

Running more raw power in to a badly matched or configured antenna will also give you more RFI problems. I know this first hand: I was interfering with my TV and my neighbor's TV's because of my ground situation (I had actually done it "by the book", which turned out to be the wrong thing to do.) Tuning up your radio for peak power output will also cause increased spurs and possibly audio distortion. If anything, you want to run your rig below max to preserve the life of the hardware. In fact, the manual says to reduce power by 50% if you're running high duty-cycle modes like PSK or CW.

26171. RE: [FT897] Signalink USB & FT897D

Yahoo group: FT897 (2009)
Date: 2009-05-25 17:29:07 UTC
From: Tate Antrim
Topic: 26166 Message: 26171

I bought mine from DX Engineering and they have a complete list of what you need to set it up for each radio you have. For the FT897 I got the CAT cable specific for it and a set of jumper header blocks. You'd just need to buy the cable that works with the Kwood or whatever other radio you have. To make mine work with my kwood hybrids meant I had to get a microphone cable adapter which was a no brainer. If you are going to use it with multiple radios then get the little jumper header blocks too. That way you can plug in the internal jumper block that matches your rig fairly quickly.

Ultimately, I'd get a separate signal link for each rig and not share it between radios (if you can part with the coin to do it) and then just USB each to your PC. Split band operation would be possible that way with PSK between different radios.

That's what makes it so versatile - it is so self-contained that you can have several in your system and then dedicate software to each one. You aren't limited to having just one on your system.

Best $100 I have spent on ham radio gear to date. For the 897D, just get the one with the 6 pin mini din. Hook Signalink usb to usb port on PC. 6 pin mini din into the data jack on the back of the rig. Set your jumpers on the inside of the Signalink (very easy), then follow the step by step instructions. I was on the air in no time. I have since discovered a new world of ham radio. I make more contacts on psk31 than anything. Have received SSTV, RTTY, PSK125 as well as others. When my friend gets his Signalink, i'm gonna practice some local, very low power SSTV with him before I go calling CQ. I would say get one in a heartbeat...they are also great to deal with.

Hope this helps, 73's

You by chance have an incomming tone squelch turned on (look at the display, does it say as an example DSQ). If you have any of the incomming tone squelches turned on then the meter would show a signal, but the radio would be looking for that tone and not open up audio unless that was also present. It has caught me at least once that way...

(trimmed)

Tom, you are absolutely right.

Though I am new to ham radio I deal with a similar situtation daily as a musician with PA gear, musical instrument amps, and stereo gear. Whether a stereo amp pumping sound out of a loudspeaker, or a tranceiver pumping out RF through an antenna, the math is the same. Polar plots, filters (crossover networks), etc, the math is the same.

Even if the fellow was able to increase power by 10% without distortion or other ill effects, it would just not be audible. A just barely noticable power increase of 3 db would require doubling the power output. To gain one S reading, which is 6 db, would require a 4 x power increase. That is just not going to happen by "tweeking settings" in a menu.

As I young college student I heard a tiny 5 wpch amplifier driving a pair of Altec Lansing Voice of the Theatre (101 db/wt/meter SPL)to live levels playing the 1812 Overture, complete with cannon shots. I was absolutely asounded when I found out the amplifier used. I was sure it had to be several hundred watts per channel to achieve those levels. I was used to dealing with speakers of 85-88 db SPL.

I remember reading an article in Hot Rod magazine back in the '60's. They had taken an old Caddy and run it down the track for a blistering 20+ second ET. Without making any modifications to the engine, they got a faster ET by removing the back seat, spare tire, jack, and other loose stuff. They gained even more by removing the inside door panels, front seat, replacing it with a light fiberglass racing seat, carpet. Now they were down to about 17 seconds ET. Then they removed hood, trunk lid, doors (but for the driver's door), bumpers, and other non-essential pieces. They had a 14 second ET.

They calculated the HP increase necessary to shave off those seconds without reducing weight, and it was huge, and expensive. But they gained that performance by simply reducing weight.

We often forget that we can easier gain performance, in any field of endeavor, by removing obstacles rather than by increasing effort. One of my old bosses once told me, "Work smart, not hard."

26178. ALERT: We've Conned over 1 year guarantees

Yahoo group: FT897 (2009)
Date: 2009-05-26 19:01:48 UTC
From: Chris
Topic: 26178 Message: 26178

Just thought I would pass this info on in case anyone is interested and has a scanner or similar radio, or CB and amatuer radio.

It turns out we have been conned by the shops/companies...NOW THERE'S A SURPRISE!!! When a shop sells you an item and the guarantee runs out after 12 months, they say it's not their responsibilty to repair or replace the item. WRONG!!!!

Under EU law a product is guaranteed for 2 years, and in the UK 6 years. Apparently some guy had brought a tv from a Sainsbury's store that went wrong after the 1 year guarantee had ran out, and demanded it be repaired free of charge or replaced. The store refused, so he told them they were breaking EU law, and the manager checked with their head office. The custiomer was right, and because the old one could not be repaired, he got a brand new one.

So when your radios' go wrong after the 1 year guarantee runs out,and you still have the receipt, go back to the shop with it and demand they repair of replace. If they refuse tell them they are breaking EU law, and you will take the matter further.

Hope this is useful to you all on this group, and please pass it onto other radio groups, and friends. Oh and cancel those bloody extended warranties that you may have and save your bucks.

astratech2002
Chris.

26183. Re: Signalink USB & FT897D

Yahoo group: FT897 (2009)
Date: 2009-05-26 22:02:51 UTC
From: Randy
Topic: 26166 Message: 26183

Chip,

You will need a new cable from the Signalink to your rig, and you will also more than likely need to reprogram the dip switch inside the Signalink. This is accomplished by placing provided jumper wires in a DIP socket. The wires and programming info are provided with your Signalink. It's very easy to do, just make sure the wires are all the way down in the socket(needle nose pliers essential here). You can reprogram for different radios but it is a bit of a P.I.T.A to do on a regular basis. Much easier to get another Signalink, right Tigertronic's ;-)

Hope this helps,

Randy

Not quite true, the EU directive appears not to exist, however under the "Sale and supply of Goods to Consumers Regulations 2002", the customer of electinic goods is covered by 2 years and in cetain cases upto six years if a fault appears and was not there when first purchased.

Subject: [FT897] ALERT: We've Conned over 1 year guarantees
To: FT897@yahoogroups.com
Date: Tuesday, 26 May, 2009, 8:01 PM

Just thought I would pass this info on in case anyone is interested and has a scanner or similar radio, or CB and amatuer radio.

It turns out we have been conned by the shops/companies. ..NOW THERE'S A SURPRISE!!! When a shop sells you an item and the guarantee runs out after 12 months, they say it's not their responsibilty to repair or replace the item. WRONG!!!!

Under EU law a product is guaranteed for 2 years, and in the UK 6 years. Apparently some guy had brought a tv from a Sainsbury's store that went wrong after the 1 year guarantee had ran out, and demanded it be repaired free of charge or replaced. The store refused, so he told them they were breaking EU law, and the manager checked with their head office. The custiomer was right, and because the old one could not be repaired, he got a brand new one.

So when your radios' go wrong after the 1 year guarantee runs out,and you still have the receipt, go back to the shop with it and demand they repair of replace. If they refuse tell them they are breaking EU law, and you will take the matter further.

Hope this is useful to you all on this group, and please pass it onto other radio groups, and friends. Oh and cancel those bloody extended warranties that you may have and save your bucks.

astratech2002
Chris.

VICTORY TO THE CONSUMERS AT LAST!!!!!

Tuesday I'll have my FT-897 and SG-237 Tuner; I'm planning to hook it in to the Rain Gutters. I need to drive in a ground rod and roll out some, a lot, of radials and I also need to drive in a ground rod for the shack ground.

I live in FL and have about 1/8 in. of soil and miles of sand.
Any tips?

I rolled my own and can use it at 100 Watts as well.

Bij shortening the top section you'll get 30M instead of 40M.

Onderwerp: [FT897] Re: End Fedz antenna and 897

The Par 10/20/40 is a good performer, and the radio doesn't matter, as it is "resonant" on all those bands without a tuner. However, remember that you would have to turn the power down on the 897, because that particular model is only rated at about 25 watts. I have had a lot of fun using the one I have, along with a QRP rig like the ATS-3, from motel rooms, etc. Ideally, I wish there was one that included 30 meters, but WARC bands present very difficult matching problems for multi-band operation.

All the Par EFHW's come with a matching unit so that a tuner is not required. Unfortunately, Par hasn't produced a multi-band version capable of higher power levels, and I didn't get a very encouraging response from them when I asked if one might be available anytime soon. Some folks apparently have made some modifications to various models, so as to use them on other than the specified band. I'm not sure what they did, since the matching network is band-specific, as is the antenna length itself. Seems to me if you are going to tinker with one in that fashion, you might as well "roll your own", and save the purchase price. There is a lot of EFHW info on the web, and you can get all the info you need to make one.

Electronics (http://www.parelect <http://www.parelectronics.com/end_fedz.htm.> ronics.com/end_fedz.htm.) get amazing review on Eham(http://www.eham. <http://www.eham.net/reviews/detail/5105> net/reviews/detail/5105). Who has any experience with them used on a 897. How do you use the 10/20/40 antenna?

From: wa7ocz
Topic: 26189 Message: 26189

A couple years ago, I made two battery packs (see them in the photos section here using the moniker "modembreath".

They're still working great but I finally decided to research the connectors to get the correct ones installed instead of the makeshift ones I came up with.

I found them at Digi-key.

I opted to not buy the crimper for a whole 6 terminals and just carefully crimped them on to the pre soldered wire, soldered them on, and inserted them in the connector.

Works great.

Interested?

Digi-key carries both the housing and the sockets.

P/n 455-1184-ND (mfg p/n VHR-3N)for the housing, and p/n 455-1133-1-ND (mfg p/n SVH-21T-P1.1) for 18-22AWG.

Before you put all those radials out, try running a counterpoise under the rain gutters at ground level. Bury the part that is where someone might trip over it. Tuck it behind the shrubs next to the foundation. You might not need any radials

I imagine you need stealth. If so, my advise will be hard to implement. In QEX this year a report shows that four radials 4 feet(or more) above the ground are all you need.

26197. Re: [FT897] desperately need help!

Yahoo group: FT897 (2009)
Date: 2009-05-27 05:03:50 UTC
From: Thomas Wilson
Topic: 26188 Message: 26197

If you have a multi-band antenna, disconnect the tuner and plug the radio directly in to the antenna. Get the antenna manual out and re-read the tuning directions. Chances are you missed something along the way...some antennas need to be configured differently at ground level, for example. (The Hustler verticals are a good example: you set the length of each section differently based on whether you're roof mounting, ground mounting, or ground mounting with no radials.)

Check the antenna connections: is the cable connected properly? Is there a short circuit or a bad connection? Is the cable bad? Assuming your cable is properly connected and in good shape, then you should probably reset the antenna sections to the starting length recommended in the manual. From there, you will probably have a high SWR, but you can tune out each band, starting with the highest frequency (shortest wavelength.)

Also, be sure to check each band the antenna supports. If the higher bands work and the lower ones don't, you may have a bad trap.

Assuming the SWR isn't too wonky at this point, you should start with the highest band (6 meters, i take it, from your description.) Set the radio to its lowest power, and key up on the low side of 6 meters. Note the SWR. Do the same thing on the high side. (Remember to ID.. I have one of the 3 CW memories set to my ID.) There should be a difference between the SWR at the top and bottom. If the SWR is lower on the low frequency in the band, you need to shorten the antenna section. If it's lower at the top of the band, lengthen it. Do this in SMALL increments... the quarter-wave differencce between 50 and 52 MHz is only about 2 inches.

If you can't tune 6 meters, it's time to go heavy duty: you need to borrow or buy an antenna analyzer. An antenna analyzer is basically an SWR meter coupled with an oscillator. With that, you should be able to find out where the antenna is resonant, then you can adjust each band accordingly.

Remember to tune the shortest band first... on any antenna with traps, this will be thesection closest to the bottom and the highest frequency band the antenna supports. On a 6-10-20 antenna, for example, adjusting the 6 meter section will also affect the 10 and 20 sections. Tuning the 10M section will not affect the 6, but it will affect the 20. So it's important to adjust your tuning in the right order.

Finally, remember to adjust in small increments. As you go down the spectrum, a 1 Khz change in wavelength gets progressively longer, but unless your antenna is 60' tall, there will be some loading going on, and that means that even a small difference in length can have a dramatic difference in the electrical length of the antenna.

Try getting rid of the tunner. you do not need a tunner when using that antenna. Connect the antenna to the HF side of the 897 and tune with the rocker switch that came with the antenna. I use the side kick antenna on their tripod with their radials (8 raedials 10ft long) spread out like a wagon wheel from the tripod and cap hat. I can tune that antenna down to 160 meters with the cap hat. I get zero swr and many many contacts. That is a great antenna. You must not have it connected correctly.

Sounds like bad coax jumper to tuner or bad coax feedline to antenna. These things work loose or go bad in inclement weather.
Try another coax if your set was working fine before this problem.

When using motorized antennas, such as the TARHEEL and HIGH SIERRA, bestresults are normally obtained WITHOUT a tuner!? Tune the antenna, using its motor, for best match!? (If match is then not good enough, improve your grounding/radial system.) The antenna should be installed in the open, clear of any large/tall objects within 20 or more feet.) The radio should also be located far away, unless it is installed within, and grounded to, a vehicle or similar enclosure.? Coaxial cables/connectors need to be of high quality, and all soldered connections properly made, preferably with good 60/40 lead/tin rosin core solder. (Newer, lead-free solders do not perform, or last, as well) Installing a coil in shunt with the feedpoint of the antenna can facilitate raising the resonant impedance, if necessary, and is preferable to using a tuner.--See the ARRL antenna book, or the ARRRL handbook, for more details. As a general rule, the LESS equipment required to match an antenna, the better it actually works!-----73, KC3VO, Bob Curry

Sounds like bad coax jumper to tuner or bad coax feedline to antenna. These
things work loose or go bad in inclement weather.
Try another coax if your set was working fine before this problem.

As was mentioned by others there isn't one. But you can make your own extension cable and the head will work for up to 8 feet (the longest distance I tested).

> What would I be gaining by adding the Collins SSB filter? What exactly goes it do and how well does it do it?

My experience is that the cutoff from nearby frequencies is better. So in crowded band conditions you'll get an improvement in reception. There is also a slight improvement in SNR but for me this improvement is minimal. If you are trying to hear weak signals in crowded or noisy conditions it will help you. If your contacts are all strong in reception you money is probably best spent elsewhere...

> At some point I will probably want to upgrade to something better. By that I mean a rig with more features to help me get my signal out under difficult conditions.

... such as in your antenna. In terms of "bang for your buck" the antenna and your system's installation will improve things far more than throwing money at a rig. Do some research on stealth antennas and their installations and there may be something there which would help your particular location.

Thankyou all for your help. I moved the antenna off of the side of the house and out of the shadow of the satellite receiver. It was four feet away. I than set it up in the yard on the tripod as the manufactur designed.I also figured out how to make the tuner in the radio work. one thing I learned is you can read the manual until your blue in the face but until you get your hands on the knobs and move some switches you really don't understand what they do. At least not me. OH YEA ALLMOST FORGOT, Made three contacts, one on 40 and two no 20 meters. All in the Denver area. Thanks again this group is TRULY AWESOME.
P.S. My next step is to take the advice of a local ham and buy a real antenna, at least for base station use.

26207. firmware bug...

Yahoo group: FT897 (2009)
Date: 2009-05-27 21:39:23 UTC
From: Thomas Wilson
Topic: 26207 Message: 26207

I discovered a bug last night in the radio's firmware:

If you're talking on a repeater, you can use the REV function to listen to the input frequency. On my other radios, if you switch memory channels while the REV function is engaged, it simply disengages, switching back to regular listen mode.

Last night, I had the REV function engaged on the FT-897, and I used the wheel on the mic to switch to the next higher channel from 52 to 53. The radio ERASED the memory settings in 53, overwriting them with 7 MHZ LSB.

So use the REV function with care, and never, never change channels when listening with the REV mode.

Tom,

Have you have reported this to Yaesu?

I ran across this about 2 months ago and reported it. They said they could not duplicate it and that I was the only one who sent this information to them. They had me hard reset the radio but it still does it.

If they get enough complaints, maybe we'll get a fix......

I need to test it a little more... I've established that it happens with the remote mic, but I haven't tried it yet while turning the console knob. It might be limited to a specific set of radios, which may be why the support folks haven't duplicated the problem.

Do you have an 897D or an older 897? I wonder what our units have in common that's different than other radios....

can anyone else on the list test this and see if you can replicate it? (I'd suggest backing up your radio's settings or setting up a couple of new memory channels before testing this...) Also, try it with the *knob* on the remote-control mic, the up/down buttons, and the front panel tuning dial.

Nope. 897 faceplate can be removed and a custom cable made. Which makes sense as it is the same electronics as the 857. As mentioned I had the head working with an 8' cable. You'll need to fabricate a holder for the faceplate and the fans are exposed on the body and so you might want to fabricate a cover for that. The faceplate is held on by (IIRC) four screws. You'll need to remove both the top and the bottom chassis covers to reach those screws. There are 3 cables with around (again, IIRC) 15 wires total. I used a 25 wire parallel printer cable to make the extension. I never found the source of the plugs for the cables and so you may want to pull the cables from an inop unit to splice into.

This was done just as a "let's see if it works" type project. I had a hypothesis that it should due to the electronics as mentioned above. I did not have one of the external meters and so I do not know how that accessory would be affected.

PS - I debated on whether to use two RJ-45 outlets for the cable connections or a single DB-25. I wound up just going with the DB-25 to avoid confusion about which cable went into which outlet. After it was over IMO I wish I had gone the RJ-45 route and color coded the outlets and cables. I soldered and shrink wrapped each strand and it got to be a pain <g>. With Panduit and similar systems you can just lay the wires out in the plug insert, snap the cover down, and you are done.

Now should you do this project? Well, IMO no unless you just want to see for yourself or are limited on funds. The 897 (and the 857) IMO make very poor mobile setups anyway due to too many button presses when switching modes. If this unit is your only choice or you are a single mode operator then you might consider it. Personally I would sell it and purchase a (yes, I know, boo hiss) ICOM for mobile use. For me the 897 works better sitting on the desk.

Topic: 1970 Message: 26215

Just a personal observation here, not related to whether or not the 897D or 857D is ideal for mobile operation.

I've owned an FT-857D -- traded it for a second 897D. Sometime I'll get another 857D to mount in my mobile. It's a great radio. I'm building a new console now for my pickup and I'll leave room in it for the 857D.

Either way, it shouldn't matter.

If you're finding yourself with too many button presses to change freqs, modes or whatever you should pull off the road. I don't care if you're running an 857D, 897D or Icom IC-7000 (a very nice radio), if the radio is taking your attention away from the driving task at hand -- pull off the road and stop while you deal with the radio issues.

Amateur radio mobile operation has an excellent safety record because we, as amateurs, have traditionally taken all necessary precautions to ensure that our mobile operations do NOT interfere with driving the vehicle. Many times on our local repeater you'll hear, "I'm gonna get both hands on the wheel now. 73. K5XXX"

Let's not become part of the "talking on the cell phone, putting on make-up, shaving on the way to work" crowd. As I was told by my instructor in primary flight school, "Don't drop the aircraft to fly the microphone."

Although we are called "Amateur Radio Operators", that's because we're not paid -- we can still maintain professional standards, including our driving.

The beacon can be activated in any mode (AM, FM, SSB CW, CWR) on any band. Great for providing propagation tests or letting it run and see if you get any QSL replies! Just remember to use it where appropriate and not upset people by letting it run where it shouldn't be used!

> Could each end of the cable have a male and a female RJ-45 so you would have to color code them?

Yes. Using inserts gives you a variety of colors for the plugs. Most suppliers carry at least 5 - blue, orange, black, white and cream. It's been a few years since I did this but now that I've thought about it the reason I didn't go with RJ-45 was that there may have been more than 16 wires. 17 maybe? This would have required 3 cables and by this time it seemed like it was easier to just go the DB-25 route. Now that I've done it though I probably would have gone back to RJ-45 if I were to do it over.

> I fully understand the too many buttons problem.

This is the main advantage Icom has IMO. It maintains the settings in memory for each band/mode. So switching from VHF/FM to HF/SSB involves just pressing the band change button. And before the fanboys get their undies in a wad I do use a 897 for my office location and when portable <g>.

I have an 897D but I got tired of trying to remember the button sequence. Maybe when I was younger, it would be so confusing when I wanted to change modes or change the view in the display, but it was getting confusing and the level of white noise all the time was bothersome. In January I got an Icom 746PRO and it has more buttons and fewer menus to navigate and the white noise is much less. However, it isn't as portable nor does it have 30 meter band, nor dopes it have 440 mHz

Hello at all Radio Friends :)
I would like to invite You to visit the website of one of my friends , SQ9IWU mr.Richard from Katowice, Silesia Province , Poland.
Richard, me and our friend SQ9HHT Paul (blind operator) , we made trips to Lysa Hora 1324m a peak in Czech Rep.
Lysa Hora is our standard place to made QSO`s over Europe on 2m and 70cm... and more :)
After very short registration You can see our pictures from our trips in photo galery.
Link to the WebSite of SQ9IWU: www.sq9iwu.qrz.pl
With the end of Juni we go to visit HAM Fest in Friedrichshafen in Germany... maby we can meet us there? ;) i hope for that :)
with best rgds

26224. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2009)
Date: 2009-06-01 07:24:15 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 26224

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

I don't know anything about their offer. Personally, I would be very wary - one of the IFs is 68.3 - rather close to 70MHz. At the end of the day - as they say - it is your radio.

26226. Re: [FT897] Re: Signalink USB & FT897D

Yahoo group: FT897 (2009)
Date: 2009-06-01 17:29:01 UTC
From: af6cm_yahoo@myfastmail.com
Topic: 26166 Message: 26226

Last week I built a cable for my FT757 to be used with the Signalink.
There are two advantages to this: it's less $$ and there is no need
to open the box and change the jumpers.

The connector is the same connector that is used for ethernet
cables. I happen to have a crimper tool and connectors, but
you could simply sacrifice an extra cable, if you have one.

My technique was to: have a cable with the RJ connector and
the wires at the other end stripped. I ohmed-out the desired
signals, and soldered them to the correct pins on my radio
connector. The unused wires were simply cut to varying lengths.

Now I can use the same box with either radio. No need to fiddle
with the innards.

wrote:

Chip,
You will need a new cable from the Signalink to your rig, and you
will also more than likely need to reprogram the dip switch
inside the Signalink. This is accomplished by placing provided
jumper wires in a DIP socket. The wires and programming info are
provided with your Signalink. It's very easy to do, just make
sure the wires are all the way down in the socket(needle nose
pliers essential here). You can reprogram for different radios
but it is a bit of a P.I.T.A to do on a regular basis. Much
easier to get another Signalink, right Tigertronic'
s ;-)
Hope this helps,

The jack on the back is for data communication: things like PSK, Packet, SSTV, and such. It does not carry microphone audio. Unfortunately, the FT-897 doesn't have a talkback option, like the 450 does. I can think of several ways to do it, but they all involve various levels of compexity that are far above & beyond a simple patch cable.

What you really need is some sort of "talkback" adapter that can connect to the mic jack; it would have to have an audio mixer to bring the rx audio down to a safe mic level, then send both out on a wire. You could then plug that in to your recorder, getting both RX and TX audio. I'll keep my eyes open for anything I see in that respect.

From: KD8CCX - Adam Filkins
Topic: 26227 Message: 26232

I use Audacity, a free recording program, and I record the QSO with a computer microphone where it picks up both my voice and the 897D. It works quite well. The only way that I could think of to record both transmission and receiving would be to have a receiver only or a 2nd Transceiver set up to catch both.

Give the Audacity and computer mic a try - you will be surprised by the results.

73's and good luck.

connect a recording device to an external speaker to rig, turn on
monitor funtion (lets you monitor your transmit audio through
speaker), records both the received signal and your tran smi outgoing
- all through the external speaker

26234. Re: [FT897] recording transmissions

Yahoo group: FT897 (2009)
Date: 2009-06-02 02:28:25 UTC
From: Randy Charles Ford
Topic: 26227 Message: 26234

What about using a transmit/receive switch like for an amplifier to record from the CAT output normally, but switching to a room mic when you transmit? Audio quality of the received signal may be better, and you wouldn't pick up room noises unless you are transmitting. With some more work, you could pick up the transmitted audio directly from the rigs mic cable.

The problem with using a second receiver would be that you would have to tune it everytime you tuned the primary rig. That might not be an issue, depending on how you are using the recorded audio.

73,
kg4jix - randy.

Where is the monitor function? My rig has a MON soft key, but that
just temporarily breaks squelch. A monitor or talkback function IS the
ideal solution.

That is an inductive pickup. It picks up the speaker's magnetic field.
But with no talkback function (that I can find), an inductive pickup
won't work any better than the data port.

Btw, the data port works fine for receive... bit we need a way to get
TX audio. I'm leaning toward splitting the mic line and using a small
mixer to mix in the rx audio

The normal description for what you are looking for is "sidetone", it is used for voice as well as cw.

As far as I am aware the 897 does not have sidetone on voice.

The only way, other than just using a mic on the computer to pick up both sides of the conversation, that comes to mind would be using the computer mic to drive the radio and recording that as well as the incoming audio from the 897.

How exactly do you turn on the Monitor function? I have not seen this before, but that would be great!!!

This group is great. You learn something when it's not even your question!

connect a recording device to an external speaker to rig, turn on monitor funtion (lets you monitor your transmit audio through speaker), records both the received signal and your tran smi outgoing - all through the external speaker

26240. help needed - Soundcard Interface

Yahoo group: FT897 (2009)
Date: 2009-06-03 16:39:44 UTC
From: Adam Karsin
Topic: 26240 Message: 26240

Good afternoon,

I am sending this to a large group of folks to get this information request out as far as possible. I'm sorry if it is off topic for the list, please reply directly to me: akarsin@...

Ok, here is what I am trying to do:

Use my FT-897 for digital modes I have currently the 897, a soundcard interface made by Saratoga and I think it's connected properly.

I am using a laptop with Windows Vista, and running Ham Radio Deluxe with DM780 as the digital module.

Here is what I have done so far, and I hope I cover everything I have done.

note in the past I have run a speaker between the rig and computer, the speaker has 2 plugs on it, so that I can monitor audio as well as allow the computer to "hear" the audio as well. This worked well to receive. In order to send I had to get everything in the "TX" box, then grab the mic and key it up, hold it near the computer speaker and hit send in the program. It was functional, ableit cumbersome.

Now I have added the EZ-PSK inline. What I have so far is this:

The rig has a 3.5mm speaker jack on the back. I added a spliter to be able to plug both the speaker and interface in. there is a wire that plugs into the mic jack. There are 2 wires that plauc into the speakers and mic jacks on the computer and finally a USB cable.

That is the interface.

The radio is connected for CAT control to the computer. This connection SEEMS to have no issues, I can control the rig from the program (HRD/DM780). Well, except I can't seem to get the DM780 to key the rig..

The computer seems to see the interface, or as best I can tell it does.

A few things I have noticed and they may be smaller issues that will work them selves out when I get it running right, but even though I have the interface pluged in to the mic/line in jack on the computer, the on board mic still seems to pick up all the noise in the room. It's not even picking up the audio from the line.

Ok, so I am at a total loss here!!

Any assistance, advice or guidance is greatly appreciated!!

73,

Adam

From: Thomas Wilson
Topic: 26240 Message: 26241

First off, dump the speaker splitter and front panel mic setup. Pick up a 6-pin mini-DIN connector (or PS/2 keyboard cable) and use the radio's data port. You won't need to constantly re-adjust your volume and gain settings, and you can leave your mic and speaker plugged in.

The problem you're probably having with the mic is related to your Windows setup. You need to tell DM780 to use the LINE input on your sound card. Press the F8 key and choose the Sound Card tab. From there, choose the Line input as your input source.

Vista is kind of funny about input sources... as a long term solution, I'd suggest returning the Easy PSK and getting a Signalink box. The Signalink has a built-in sound card, and it's a much simpler setup. It also includes a cable that connects to the radio's data port, simplyfing your whole setup.

I'll have to sell it off, as I picked it up second hand.

I know there is a wiring diagram out there to change this over, I just have to find it...

As for the DM780, I'll try that now

Thanks,

Adam

DE N7UVL,
The US Version "D" model (unmodified) is channelized for
the 60 Meter Frequencies. Pages 23; 45; 60 of the
Manual. If the 897 has been modified, such as for MARS,
the 60 Meter frequencies will have to be re-programmed./ga

There is no transmitted audio monitor in this radio like there is in the higher end ones.

You have to do it with another receiver (pain in the a**), or just with a second microphone.

Subject: Re: [FT897] recording transmissions

That is an inductive pickup. It picks up the speaker's magnetic field. But with no talkback function (that I can find), an inductive pickup won't work any better than the data port.

Btw, the data port works fine for receive... bit we need a way to get TX audio. I'm leaning toward splitting the mic line and using a small mixer to mix in the rx audio

If the radio is the FT-897D model, yes. Same holds true for the FT-857D.

I am waiting for the arrival of a Tigertronics USB interface for my 897. I've seen an occasional mention that some rigs are very sensitive on the mike line and need a 100k resistor in place of a jumper on the internal header. Is the 897 critical of levels in this manner?

Assuming you ordered it with a 6-pin mini DIN connector (you use the DATA jack, not the mic and speaker jacks), it should work just fine without the jumper. The radio has an adjustable gain control and the Signalink has an adjustable output level control.

Correct.. don't run it in the Mic lead. I use one on my Remote Base and run all the audio through the data connector. Both Voice and Data (after all, what is data other than audio tones-just like voice). J

Subject: Re: [FT897] Tigertronics USB

Assuming you ordered it with a 6-pin mini DIN connector (you use the DATA jack, not the mic and speaker jacks), it should work just fine without the jumper. The radio has an adjustable gain control and the Signalink has an adjustable output level control.

It was ordered with the 6 pin cable. My Visa was just charged today so I guess it is in the mail. Thanks!

Has anyone any experience with having an FT-897D modified to work the 70MHz allocations?

If you can get hold of RADCOM and don't mind some building, they did the
received side of a 70MHz transverter last issue and will do the transmit
side this issue. The 897 is designed to work with transverters.

26257. Re: Tigertronics USB

Yahoo group: FT897 (2009)
Date: 2009-06-04 14:24:18 UTC
From: ve3wmb
Topic: 26249 Message: 26257

You'll have no problems with the FT0897 and the SignalLink USB. Just wire up the internal connection block according to the instructions supplied with the 6 pin mini-din cable.

I have both the USB and SL1+ products from Tigertronics and IMHO both are excellent interfaces (I think one of the best out there). Construction is excellent and they are very reliable. The beauty of the USB model is that it is powered by the computer via the USB interface (so no extra power connection needed), and the gain controls for TX and RX audio are on the front of the device making level adjustments a lot easier than constantly fiddling with the mixer level controls on the computer. Also because it has its own high quality soundcard you don't have to worry about whether the soundcard in your computer is up to snuff for digital modes.

I have used the USB interface on Windows XP, and Mac OS and
had no problems with the OS recognizing the hardware. Its basically a plug-n-play solution.

Cheers

Michael VE3WMB / VA2NB

P.S. The beauty is that the FT-817 is electrically equivalent to the FT-897 w.r.t. CAT etc so my SignalLink USB wired for the FT-897 works with my FT-817. In fact I believe that the wiring for the 6 Pin Mini DIN is actually standardized across Ham Radio Manufacturers.

P.P.S. The usual disclaimer, no connection to Tigertronics, just an extremely satisfied, long
term customer.

26258. another solution for recording (and for connecting a headset without extra cables...)

Yahoo group: FT897 (2009)
Date: 2009-06-04 22:06:42 UTC
From: Thomas Wilson
Topic: 26258 Message: 26258

I was fooling around with my setup, and I discovered a program called "Virtual Audio Cable." It's designed to allow you to route audio from one program to another on your computer, all without using a physical sound card.

Well, I just discovered another use for it: it comes with a program called "Audio Repeater." AR can route audio from one sound card to another sound card on your PC.

Why is this useful? Well, with this program, you can attach a Signalink or a second sound card to your radio and plug a PC headset in to your primary sound card. Fire up the repeater program, and now whenever you talk in to the PC mic, your voice is sent to the data port on your FT-897. If you turn on the FT-897's digital VOX, you can now QSO hands-free. You can stop the radio from transmitting by using the mute switch on your mic or pressing the "Stop" button on the audio repeater.

For recording: if the sound card hooked to your radio has a "what you hear" or a "digital mix" pin on the mixer, you can record from this source. I haven't verified whether the Signalink has this pin, yet.

If anyone is interested, I'm thinking about writing a dedicated app for this purpose: it would have a keyboard PTT toggle, and it would trigger the radio by sending a low-frequency tone to lock the VOX open.

I am looking forward to the arrival of the unit. My concern was based on some reviews on eHam regarding the FT-450 and some other rigs. The issue was that the sensitivity of the inpt used and the output level of the Signallink USB required the use of a 100k resistor instead of the 24 gauge wire jumper. My fears have been dispelled. I hope to meet you all on PSK31 and other digital modes in the very near future.
Thank You

FYI: I'm driving my FT-897 with a professional audio interface; these are a +4dB audio level (compared to a -10dB level on consumer gear.)

My guess is that you need the resister is when you're plugging in to the mic port, which you should NOT do with the Yaesu's, since they have a data port.

The good news is that you can use the software mod on the older 897's...
once you've done that, you can either program memory locations with those
frequencies, or you can manually tune them.

From: Thomas Wilson
Topic: 26243 Message: 26264

I have not used the software mod; it doesn't work on the 897D.

It involves sending a specific CAT command to the radio which tells the
radio to write to the jumper locations in memory.

http://www.ham.dmz.ro/yaesu/ft-897-jumpers-by-software.php

This is a DOS program, and it requires you to use COM1, if I recall.
However, there's a way around that problem.. you can run the program with
the parameters to set the jumper, and it should tell you what CAT command
it's going to send. Switch over to Ham Radio Deluxe and use it to send the
CAT command manually. When I get home, I can look up the specific sequence
(I wrote it down...)

26265. Re: [FT897] 60 meter operation

Yahoo group: FT897 (2009)
Date: 2009-06-04 01:44:16 UTC
From: Brian Esche
Topic: 26243 Message: 26265

The FT-897D will operate on the 60m frequencies without modification (see memories 601-605). However, the FT-897 (non-D) requires a modification to operate on 60m.

73, Brian WB9QVR

Hello
Will the FT897 operate on the 60 meter band?

26266. FT-897D for satellite operation?

Yahoo group: FT897 (2009)
Date: 2009-06-05 13:27:06 UTC
From: mastertnslw
Topic: 26266 Message: 26266

Hello everyone,

New to this group, and new to amateur radio. I'm definitely looking hard at the FT-897D as the main transceiver for my base station. One of my big interests is working amateur satellites, as well as downlinking images from weather satellites.

Does anyone have any experience using this radio for working satellites? Good? Bad? Problems? Suggestions? Any feedback would be most appreciated.

Thanks very much!

Theran

26267. Cross-banding with the FT897D?

Yahoo group: FT897 (2009)
Date: 2009-06-02 02:35:35 UTC
From: ka9ofapancho
Topic: 26267 Message: 26267

Someone was talking about cross-banding and was wondering if it was feasible to cross-band using the FT897-D.
Is it possible to do cross-banding with the FT897D?
If so, how would I go about doing it?

Pancho - KA9OFA

26268. About to purchase FT-897D, need some advice on which accessories are important

Yahoo group: FT897 (2009)
Date: 2009-06-05 04:40:11 UTC
From: G. Hopper
Topic: 26268 Message: 26268

I've been reading posts in this group for a couple of weeks and while I picked up some great advice, I haven't been able to find satisfactory answers to several specific questions. They generally relate to the accessories that I might really want to have to fully enjoy my new rig.

I plan to use the radio mostly for: travel (both local day trips and `longer' trips), for part of a group effort activating local islands for IOTA and US Islands, some `classroom' demonstrations (as part of both license classes and demonstrations to govt. officials on amateur radio), and as a second radio in my shack. I will likely use it for some digital mode stuff.

I suspect it is too heavy to take with me while hiking in the mountains (I already carry about 25-30 lbs in my pack) but if it weren't, I might bring it too!

Beyond the 897, I'm planning to purchase a LDG AT-897, a DTMF microphone, some sort of `power', and beyond that I'm just not sure what I really will need (and want.)

On the microphone, I've seen mention of two different Yaesu models: the MH-36 and the MH-59. The 59 looks like a very convenient extension of the control panel and I'm inclined to purchase that, but I sometimes tend to be overly impressed with lots of extra buttons. Any thoughts on mic choices?

On the `power', I'm trying to avoid going crazy buying accessories I'll never use and also not buying new what I can live without for a few weeks or months while I shop for a good deal on `used' versions of the same thing. I really like the idea of a power supply `built' into the radio as the FP-30 would be. I also recognize that I can haul a 25-amp switcher around too. I'm inclined to pick up a FP-30 new (when I get the radio) since I don't see them on eham or QRZ very often. What can be found for a good used price, or should I just forget it and buy new?

Batteries and the couple of other adapters that they seem to need was another vexing area. I do have a couple of larger gel cells to start with but I'm inclined to purchase aftermarket internal batteries as my experiences have been that they are often better thought out than the OEM stuff since batteries are often treated as an afterthought by the radio manufacturer. I'm a little hazy on if one NEEDS a CD24 or what convenience it provides (is it really just a fast charger?) and again I wonder if a 3rd party solution is better. Do the Yaesu batteries do better or is a particular after-market battery a better choice? Who's adapter is a must have?

I'm really sold on the LDG AT-897 and was planning on pairing that with wire dipoles and the buddi-pole depending on the situation. I can't see any reason I'd want to consider another tuner over the AT-897. Am I wrong?

I'm pretty good with a soldering iron and wire strippers so I figured I'd make my own cables, but my time is worth something and I'm not looking to waste time when someone has a

better deal on premade cables. This includes the CAT cable and interfacing to a sound card or a TNC. IS the better choice to buy them? Does Yaesu even supply a set of the connectors like Kenwood does?

Any other advice to a would-be 897D purchaser (owner)?

Thanks and 73,
Grant

Hello all,

Was originally an 857D owner selling out of necessity. I am now about to become the owner of an 897D. The only thing I wanted to add right now is I was looking at the freeband pics on how to open up TX and RX and Radio Shack has a conductive ink pen that removes with acetone. This way you don't need to use a soldering iron!

26270. Headset for VOX Operation

Yahoo group: FT897 (2009)
Date: 2009-06-04 23:30:12 UTC
From: k8rjl
Topic: 26270 Message: 26270

Hi All,

Getting my 897D very soon. I have heard the VOX is outstanding on this radio and I look forward to using a nice headset with it. What do you recommend? I don't necessarily need expensive if something cheap is of good quality. I'm really looking forward to the arrival of my radio. Is there a specific serial number I should look for? I am buying a new one, not used.

Thanks for the help,

Rob

Topic: 26272 Message: 26272

The FT-897 control head is not DESIGNED as a "remote" unit, but it IS possible to remove it, and fabricate cabling to enable "Remote Operation"!---Understand, of course, that this requires skill, and is NOT a YAESU recommended procedure, therefore it is not warranted. If you screw up, you are "On your own"-73, KC3VO, Bob Curry. (Years ago, I performed such an alteration to a YAESU FT-747 to make a rig for my motorcycle.)

I have a Heil Traveler and a Heil ProSet 5. They both work great on VOX with the FT-897D. If you ever plan on using a footswitch or handswitch (rather than VOX all the time) the ProSet 5 is a better choice, since the radio-specific adapter is made for that. WIth the Traveler, you'd have to make your own adapter to accomodate the switch. Or use the switch in the cord which I just didn't find ergonomic. A friend of mine also has a Traveler and he likes the switch just fine.

Neither headset can be called cheap, but they're extremely high quality and reasonably priced.

Hi Rob,

I recently purchased a very nice headset microphone, that has worked out very well for me. I also have a Yaesu FT-897D. The headsets are very reasonable. I got mine off of E-Bay from W2ENY. He has different mic. adapters for different radios, that way if you have several radios with different mic. configurations, you only have to purchase one headset. Hope this helps. goodluck and good DX.

Hi Rob

I use the Heil Proset Plus and it has 2 mic elements. One for DX and ne for rag chewing quality. There is a slide switch to select either mic. I get great audio reports and the VOX is perfect. Also has a built in connector for foot switch. I also have the Heil Proset standard. One mic element. Also works great. Can't go wrong with Heil.

Grant, please see my answers below.

73, Brian WB9QVR

I suspect it is too heavy to take with me while hiking in the mountains (I already carry about 25-30 lbs in my pack) but if it weren't, I might bring it too!

- You are correct - although one could carry it while hiking it's heavier than most would want to pack.
On the microphone, I've seen mention of two different Yaesu models: the MH-36 and the MH-59. The 59 looks like a very convenient extension of the control panel and I'm inclined to purchase that, but I sometimes tend to be overly impressed with lots of extra buttons. Any thoughts on mic choices?

- If you don't need DTMF functions there is no need to purchase the MH-36. The MH-31 that comes with the radio is quite adequate. The MH-59 is nice for remote control functions but it is really for mobile operation so that one doesn't have to reach down to the front panel of the rig. In a base or portable situation there's no real advantage to having the extra controls on the mic.
I also recognize that I can haul a 25-amp switcher around too. I'm inclined to pick up a FP-30 new (when I get the radio) since I don't see them on eham or QRZ very often. What can be found for a good used price, or should I just forget it and buy new?

- Whether or not to get an internal supply largely depends upon what you intend to do with the rig. If you're going to be taking it from one place to another where AC power is available it's probably more convenient to have the internal supply as it makes a nice convenient package. However, if the rig will be used portable most of the time the internal supply would just be 'dead weight' to carry around. If the latter situation is the case I would purchase a small external PS and use it when AC is available.

Do the Yaesu batteries do better or is a particular after-market battery a better choice? Who's adapter is a must have?

- If you're referring to the internal batteries there are really only two choices (unless you want to home brew something): Yaesu's FNB-78 or W4RT's OPP-897. For either pack you will need either Yaesu's CD-24 charger or the W4RT OFC-897 charger. In my opinion the batteries from both sources seem to have about the same characteristics so I don't see any advantage either way. However, unless you REALLY want the convenience of the internal batteries I would go with some sort of external battery. The Yaesu/W4RT packs are only 4.5 Ah each and by the time you've purchased two packs (to provide 9 Ah capacity) and the charger you will have invested at least $270 (more for the Yaesu gear). That's a lot of money for 9 Ah of battery power. One can purchase 7 Ah gel cells for around $25-30 and a small charger for around that same price. Also, I've found that both the Yaesu and W4RT

packs tend to self-discharge rather quickly (in a couple of weeks) so it's necessary to keep them topped off. To sum up - you'll get a LOT more bang for the buck if you use external batteries - they just aren't as 'elegant' a solution as the internal ones.

I'm really sold on the LDG AT-897 and was planning on pairing that with wire dipoles and the buddi-pole depending on the situation. I can't see any reason I'd want to consider another tuner over the AT-897. Am I wrong?

- The LDG tuners are very good. If you plan to purchase a tuner that will be used only with the '897 then the AT-897 is a good choice. If you think, however, that you might want to use a different rig at some point the future you could purchase one of the other more rig-agnostic models which will of course still work just fine with the '897. The AT-897 has the advantage of being able to bolt onto the rig which does make a fairly nice package for portable use. However, it goes without saying (even though I'm saying it here) that it would be best to use resonant antennae if at all possible to avoid the losses in the tuner and in the coax in high SWR conditions. I'm not saying that a tuner is bad but it's worth remembering that 'antenna tuners' don't really tune the antenna - they just make the transmitter happy.

This includes the CAT cable and interfacing to a sound card or a TNC. IS the better choice to buy them? Does Yaesu even supply a set of the connectors like Kenwood does?
- No, Yaesu doesn't supply the connectors. However, there are a number of sources on the web (including eBay) where one can buy pre-made CAT and TNC cables for very little money. Personally I'm not a big fan of trying to solder wires to those mini-DIN connectors so I found it easier to part with a few dollars for the pre-built cables rather than do it myself.

Thanks and 73,
Grant

How are you measuring your power? Are you using a meter into a dummy load? What modes are you using while measuring it? Are the meter and dummy load accurate for the frequencies you are measuring? What bands have a problem. Have you tried using a different meter and different cables? If you are not using a dummy load, could there be a problem with your antenna or cabling?

We can't help very much without more information. Please let us know more so we can help.

I'd say the Heil ProSet would be the one. The Traveler doesn't have a full earcup. Although you can modify it to use the ProSet replacement earcups if you build a plastic adapter plate as I did. ProSet's still the best though.

"Full Power"? do you know how to measure the power, and do you have the proper equipment? I find that many operators do NOT have proper equipment to measure AM or SSB power, nor do they understand how this power SHOULD be measured, or why! If you use a cheap CW/FM type RF power meter, a properly operating 100 watt SSB transmitter will normally indicate about 30-35 watts when actually putting out 100 watts of voice modulated SSB signal! WHY only 30-35 watts? Because you are NOT using the correct meter! To see the true power, 100 watts, a more expensive, PEAK-READING RF power meter, such as the BIRD 43P is needed, because the power is composed of short duration PEAKS that cannot be correctly captured and displayed on a CW/FM meter. IF the radio is OK, using this cheaper meter WILL show about 100 watts power if you use FM or CW mode on the radio, instead of SSB or AM to check the power. Further information regarding this issue may be found in the ARRL amateur radio handbook.--73, KC3VO, Bob Curry

No, you can't cross-band with the 897. You could if you attached another radio via the data connector, but you'd have to custom fabricate a cable that uses the squelch line to activate the TX on the other rig, or you'd have to have VOX on both rigs.

Topic: 26268 Message: 26286

I'm gonna echo what Brian said, for the most part.

The 897 is a nice radio, but choose your options with care:

Batteries: when you can get a 20 Ah jump-start pack, complete with 200 watt inverter, for $100, it doesn't make sense to buy the internal batteries. You're limited to 20 watts on internal power anyway, so pick up a jump start pack and a second power cable. Attach a set of PowerPole connectors to the jump start kit, and you can go portable pretty easily. Alternately, you could source some 6v cells and mount them inside, but connect them to the external power connector, NOT the internal connector. Pick up a small auto-charger to charge the batteries. (I use a Black & Decker auto-charger. It peaks the batteries and then switches to a small maintenance charge.)

Power supply: This is one area where I'm strongly considering getting the attachable power supply. It just makes sense, and it's one less thing to clutter up my shack. Right now, I'm using a Westcom 35 amp power supply; but there are some small 25A switchers that will work fine... I just like the headroom.

Tuner: I use an LDG Z-100 Pro tuner. You can piggyback the power connector; one less cable to run. Any good tuner will do; don't get the Yaesu tuner; it can only match a 3:1 or less SWR; it's not for running "out of band" antennas; it's for fine-tuning the match on bands where the antenna's SWR bandwidth is smaller than the band's coverage (such as the 3.5 Mhz 80/75 meter band.)

Mic: I bought the MH-59, mostly because it gives me shortcuts for IPO (disables the RF preamp), Attenuator, and RF power controls. I can also scan the band by just holding the "up" control for 2 seconds, and I can direct key frequencies. In all, I think it's a good purchase. But definitely turn the SSB gain down to about 10 and enable the speech processor.

Speaker: I use a small external speaker (actually the center-channel speaker from a cheap surround-sound system.) It definitely makes things sound better than the internal speaker.

Finally: amplifiers. About 75% of the time, if I can hear a station (at *any * power level), they can hear me. Keep in mind that a 400 watt linear is only 1 s-unit of extra signal, but that 1 s-unit might also make the difference in a pileup. The key consideration there is going to be your operating location. If you're going to deploy this for portable ops, consider a small solid-state amp. If you're going to be stationary, then you can certainly hook up a big gun. But also remember that $1 of antenna is worth $10 of amplifier... I'd start by optimizing my antenna system before

looking at power. A good antenna helps your receive and your send.. and if you can't hear it, you can't work it.

I can't comment much on portable antennas, yet. But I'm working on some ideas. :)

Do you mean cross-band split operation, or cross-band repeat?

Oh, duh... guess that's a good question

The radio is not capable of cross-band repat, but you can send and receive on two separate bands easily enough: just use the split function and set VFO A and B to any two frequencies the radio is capable of working.

Rob, hands down the Heil is the best if you can see your way with the money. They are not inexpensive but very very good and the support is the best. I have both the "Travler headset, duel side and the "Pro set plus".....they are both good for VOX. If you have "big ears" as you say, I may lean towards the Pro set, that unit has larger ear cups.

Agree 100%. I ran my 897 at 100 w SSB in the park from my Husky Power Center (also makes cappucino) for 2 hours one afternoon. I did what Tom suggested, made a pigtail coming out, directly connected to the battery, with PowerPoles. I bought a 10 ga power cable on eBay, but same is available from www.powerwerx.com, and put PowerPoles on that, too.

I have the LDG AT-897 tuner, Yaesu FP-30 power supply, and could not be happier.

I installed a BHI, Inc. DSP internally in the 897, but if I had to do over again, I'd just get the West Mountain Radio CLR-SPKR (using this now with an Icom 718), which has its own 2w audio amp and a great DSP. In fact, the DSP sounds the same as the BHI I have in the 897. The 897 benefits greatly from both a larger, better speaker and a better DSP. I added to the mix a West Mountain #4008 RigRunner to plug everything in. I suppose you could rig up a pigtail coming out of the FP-30 to run the CLR-SPKR. Many radios benefit from an external speaker.

I didn't have any use for the MH-36 mic with my 897, as it is used as a base station, not mobile, and traded it for a spare MH-31 (the plain jane regular mic). I don't plan on buying a MH-59 either.

Another good accessory, the LDG FT-Meter. EXCELLENT! How did I do without that? Worth every penny. Go on and buy the RigRunner so that you have a place to plug in the FT-Meter backlight and CLR-SPKR. The CLR-SPKR comes with a power cable with PowerPoles. You can buy a cable with PowerPoles for the Meter's backlight from West Mountain or make up one yourself with a Philmore 210.

http://www.westmountainradio.com/rigrunner/ppl-18.htm

All in all, the 897 is an excellent radio.

The only problem with the Audio DSP is that you get AGC pumping from nearby strong signals. The correct DSP to have is IF DSP and I don't know if there is an add-on kit or add-on modification for IF DSP. The radio already has Audio DSP, so you don't need to buy another external speaker with DSP.

Now that I have been thinking about it, I am going to need something that allows me to hear whats going on around me while working the bands. So my choice is the Traveler single side. It appears there is a new "improved" model that is out now. I am a casual HF operator and do not do contesting so I think based on the reviews from eham.net, I will happy with the choice. We shall see how much it squishes my ears..lol

G'day to you all

This is a bit "off subject" but maybe there will be a few good answers forthcoming.

I'm trying to locate a really first class site on the net whereby I can download information, lesson plans etc, at no cost, to form the basis of a good (and I hope ongoing) Basic Electronics Class and basic Homebrewing websites.

I have visited several sites but they all seem a bit too disjointed or lacking in structure.

I would appreciate a link to any good sites our members may have visited and can recommend.

Thanks

I would suggest that you try Googling "Elmer 101".

This was a collective project that was run via the QRP-L online QRP list many years ago and is designed to help teach electronic theory and practice through the step-by-step building of the Small Wonder Labs SW40+ mono-band QRP CW transceiver kit. The kits can be purchased from SWL at www.smallwonderlabs.com.

Cheers,

Michael VE3WMB

P.S. You can try the following link for starters :

http://www.qsl.net/kf4trd/faq.html

It would be very difficult to add an IF DSP.

The BHI or West Mountain DSP's are both much better performers than the 897's DSP. The addition of the BHI DSP has made it a whole new radio.

In the AE5JU folder in the Files section you will find a subfolder of sound file I recorded of the BHI DSP installed in my 897. The West Mountain Radio CLR-SPKR's DSP works similarly.

The External Audio DSP, BHI or West Mountain radio might make an improvement, but it still does not prevent the AGC pumping. The AGC pumping can only be solved by IF DSP and possibly a roofing filter. This radio was designed with budget in mind and before IF DSP was reaily available for small footprint radios.

If you not a contester or avid DXer trying to work DXPeditions, the audio DSP is probably enough.

On the subject of audio DSP.

Is anyone using an audio DSP program on the PC? I'd love to hear if there's something free or reasonably priced (< $100) out there that works as well or better than the FT-897's DSP. Bonus points if the software has the ability to direct microphone audio back to the radio on a separate sound card.

Hi,
I can supply a link to a website that has structured course material on PowerPoint slides, these are for use in studying the UK amateur licenses so you will have to consider what applies to your country, but the electronic theory remains the same regardless of your location. (I see you are VK)
I used them to help pass my advanced exam, but of course I cannot verify there accuracy in total.
They are relevant to the 3 classes of licence in the UK and of course are free since they are in the public domain.
I am not a member of the club that hosts the website so can't really comment on that part, except to say they were helpful to me. Here is the link:

Roger, not for the UK, but here is a site with classes for the USA. I know this does not help Rossco, but it may help others looking for similar classes here in the USA. There are no copyright or licensing problems. The club that put this together offers it for others to use.

http://www.w5ddl.org/techppt/chapter_pps.htm

All classes are in PowerPoint, in the first zip file link at the top of the page. Also separately further down the page. The classes are tailored for the USA's test question pool. For me these were most helpful, and helped me get from 80-85% to 95-100% on the various online practice tests. When I actually took the test, I scored 35/35, or 100%. It gave me enough confidence, before studying for the test, to also study for the next licence class, the General, which I also passed at the same test session.

I understand that Rossco is looking for something more aimed toward electronic theory.

26305. Thanks for all the helpful advice!

Yahoo group: FT897 (2009)
Date: 2009-06-10 17:24:15 UTC
From: G. Hopper
Topic: 26268 Message: 26305

Well, I wanted to post a thank you to all of you that replied either directly, or through the list. All your comments were helpful and I'm pretty happy with my new acquisitions.

I had one suggestion to not purchase the LDG AT-897 and instead get the Z-11Pro, which after I looked at it, seemed like a better choice. Unfortunately, I had placed the order an hour before I got the email on Saturday. :(

I do want to note that I had some difficulty attaching the AT-897 to the radio as the holes were slightly off, and would have caused the screws to bind in the FT-897 case (which I didn't want to happen.) I ended up elongating the holes to make it fit properly.

On the subject of the tuner, I had expected the tuner to be longer than the radio (as per several comments from this group and eHam)but the more I look at it, the more it seems dumb that it was designed that way as it makes the whole tuner (front and back) much more vulnerable, and prevents a person from setting the radio down on its back (which Yaesu anticipated - at least as far as those ears on the rear indicate.)

After looking over the project where someone (who's call I can't locate at the moment) put an AT-897 into a FC-30 case, I started thinking about a modification to the AT-897 case to protect it better. If I do anything with that I'll make sure to take pictures for the group.

Lastly, does anyone know of a source for right angle PL-259 plugs? Not the ones that have the plastic hood, but all metal ones. I found some in New Zealand, but I'd really rather buy local....

26306. Oh, almost forgot that I wanted to comment on battery advice.

Yahoo group: FT897 (2009)
Date: 2009-06-10 17:32:23 UTC
From: G. Hopper
Topic: 26268 Message: 26306

I spent some time looking at cost and convenience on the battery front and concluded that at least for most operation from battery power, A "power station" type setup is really a great idea.

I have one used mostly for helping neighbors to jump their cars and I am thinking about opening it up to install a couple of pairs of Anderson powerpoles. I also have a pair of 35Ah Sealed lead acid batteries used as portable power for a 2M station. I'm not sure I can pull 22A from the pair and have them be happy, but I'm sure they will supply sufficient current at the 20W level to live a long happy life.

I have a friend who is a tech at a local test equipment manufacturer who can get all the NiMH batteries I could use. He was talking about making up a custom internal battery. Now, if I just had the TIME for all these great projects.

Thanks again to all and 73,

Grant

I've never been much for uhf but and in the other bands it's fine but for some reason it's as deaf as a post on 70cm. I first noticed when my local repeater was giving me a signal of only 4/7 and i'm 15 minutes walk from it. I put it down to my antenna which was a co-linear. I've since replaced it with a 6 element quad and i tried to work it in a local contest. I hear one station endstopping but another station was end stopping but fading to nothing in and out, though he was spinning his beam. two other stations were trying to work me and could hear me at 5/9 but i couldn't hear them. one was very wuiet and the other i couldn't hear at all. Is this a common problem and does anyone know of a fix.

Thanks

26308. Loss of CAT port communication

Yahoo group: FT897 (2009)
Date: 2009-06-11 16:05:22 UTC
From: Lew Phelps K6LMP
Topic: 26308 Message: 26308

I seem to have lost the ability to communicate between my FT-897 CAT port and my Mac.

This affects my ability to use Don Agro's splendid MacLoggerDX program, among other things.

Here's the hardware setup: CT-62 --> Keyspan 19 serial-usb converter --> USB port. Settings on rig are Tuner OFF and TUNER/LINEAR/CAT set to CAT. CAT baud rate 9600, but I have tried them all.

Settings on MacLogger DX preferences are Port Type = Serial, Keyspan converter selected as a port, 9600 baud, 1 stop, FT897 selected as rig, DTR and RTS boxes checked, hardware delay 0,

I have downloaded and installed the latest update of MacLoggerDX, but the problems started before then. I have reinstalled the Keyspan driver. I have two CT-62 cables, and I have tried swapping them. I have two USB-Serial converters (Keyspan and IOGear), and I have tried both of them. They both show up (when connected) on the pulldown list of ports. Both converters work OK when connected to other devices, including a TNC. Both show up properly when I run System Profiler.

I'm scratching my head at this point. It "feels" like a hardware failure in the CAT port.

Any suggestions?

Thanks,

Lew K6MP

Is there an option that drops the power down for tuning like the 857D has. I saw a file in the files section but it when I run it it's as if it doesn't exist.

I'd like to see something like that, too. When I use Ham Radio Deluxe, I just use the power control slider to drop the transmit power to its lowest level while tuning and doing SWR checks, then turn it back up to TX. But that's not an ideal choice...

The 857 and 897 are similar... How do you do it on the 857?

There's an easy way to do this. I don't have time to look up the URL right now, but I will find it and post it later today. Basically, it's a small project box that puts a low voltage on the inner ring of a plug that goes into the accessory jack. The 897 is designed so that the more voltage you put onto that ring, the more it reduces power output. Its primary use was to crank power output down for use with linear amplifiers, but it works well for tuning the rig barefoot. I made one, and it works fine. Basically a battery and a potentiomenter, plus a short length of wire and a "stereo" mike plug.

There's also a hardware mod that somebody has on the Internet, but it requires soldering some components in very tight quarters, and I didn't feel up to trying it.

cheers,

Lew K6LMP

Also, that program is a DOS program; depending on your setup, it will likely flash on your screen and then disappear. It also requires the radio to be set to 9600 baud.

That program doesn't give you anything you can't get with a decent CAT program; it looks like it just sends the CAT commands to switch to AM/5w, displays the SWR, and then switches back to the previously selected mode/power level.

I'm going to spend some more time with Ham Radio Deluxe this weekend; I'm thinking of setting up macro buttons for specific modes: USB/50 for PSK, LSB/100 and USB/100 for phone, and AM/5 for tuning.

This is the "one touch tuner" (from the files section here...)
http://f1.grp.yahoofs.com/v1/IEYxSp4V1nkDJI1XGYCT568ii8Mc5kIYLeyKG0rSMMzrAWF0Ga8WF7eoUVhyO4CQthg4ftV1HvBqcZj0EdYxET9wan0MqA/DF1QQ_tuning_box_version2_for_ft_897.gif

Here's something else, too:

http://www.w4wb.com/Manuals/OTT-897-Manual.pdf

Also, the LDG YT-100 has built in CAT control to automatically tune the rig.

Yah, that's the one I was referring to. I have made one of these, and it works fine. Just make sure the plug is all the way into the jack before you turn it on. Otherwise, it will put voltage into the rig in places you won't want it to go.

WOW!!

Thats all I can say. I have my 897D and I love it so far. VOX is awesome with the traveler single side headset and what a great radio. My only question is that the display seems to have a real limited viewable area. I have made all the menu adjustments and it seems the best if I view it a little to the right of center. Does this seem to be what everyone has noticed as well or do you think my display might be off? I can't seem to darken it down enough either I am keeping the contrast at level 6.

I have not used

Make turn OFF the Automatic CW mode. (Menu 22). I discovered that with it on, the radio thinks that the PTT line on the data port should be taken as a request to transmit CW.

I found that the built-in VOX on my Signalink is not be sensitive enough for voice; you can either turn the volume up all the way in the computer's sound settings or ignore the VOX/PTT setting on the Signalink and use the built-in VOX on the transceiver. If you use the radio's VOX setting, disconnect the PTT jumper inside the Signalink. The jumper that's supposed to increase VOX sensitivity doesn't make much difference for me.

If you use the Signalink's VOX, set the DLY to max (about 2 seconds.) If you use VOX on the radio, set the hang time in the radio in menu 087. Set that to 2000 or so.

I recently had this problem and had found that the SMT fuse for the CAT port had blown (I'm sure I unintentionaly hot swapped the CAT cable). I lost total use of the CAT port. I located the fuse and pondered replacing it myself, but elected to return it to Yaesu as the radio is under waranty. The day I received the post card in the mail stating that they had received the radio, the big "Brown" truck tooted out front and left me my radio... less than 2 weeks from the time it broke.

Good luck.

Steve,

Output power definitely spikes to values up to 6 times the set value.

I thought this only happens in AM (this is a known 'feature' of the 897).
But today I hooked up de digital scope and did some measurements.

When set to 5 watts the first 'dit' displays a significant spike (the rest
does not). The same happens in FM.

See http://www.pa3bca.nl/ft897qrp/ for some screenshots I made.

I measured the voltage on a dummy at 7 MHz. In FM the overshoot is about 2.5
times.

This should also be tricky for TR amplifiers.

Regards,

Minto pa3bca

Date: 2009-06-14 15:08:57 UTC
From: Catherine
Topic: 26329 Message: 26329

I'm at wit's end on this one.

My 897d and ATAS-25 work great on all intended bands except for 6 and 10 meters. I've tried every possible configuraton of the ATAS-25 and spent about two hours trying to find the "sweet spot" on the antenna slider in all of the different combinations concentrating on the ones indicated by the manual. No joy. I've tried grounding the base of the antenna, no difference. Moving around to different locations, again, no difference.

I really like the antenna for it's versatility and recently used it to service a community event on 2m and 70cm where it performed like a champ. Net control said I had the best signal in spite of being the furthest sation. WHich seems odd, since the VHF UHF elements are just horizantal wires poking out of the base.

If anybody has used this antenna on 6 or 10, I'd be interested in you input. Or, even if you havent used and you have any ideas to get me up on 6/10.

It's probbaly a loose nut behind the knob. :)

I could be totally off-base, but it sounds to me like some capacitor is
being charged to provide current to get the radio transmitting at full power
right away. I can see why it's important, since CW signals should have a
sharp rise.

Does the power chirp like this at 50 or 100 watts?

I just tried it at 50 watts. Upon keying output peaks to 100 Watts and then falls down to 50. Subsequent dots and dashes are 50 Watts.
At 100 watts there is no peak (which does not surprise me).
It is definitely a design flaw (well known for AM mode). I just hadn't realized the 897 also displays this behavior in other modes with decreased power. But in AM the carrier is decreased to 100/4 = 25 watts by the same circuitry so it is no surprise. (hindsight)

Chris, a local communications tech worked with me last night and we determined with his watt meter that it was not the internal power supply and the power output dropped rapidly above 14 MHz to 5W out at 50MHz. The 2M and 70cm output was OK. Also the PA output transistors were drawing way too much current and getting very hot before the fans turned on. Bob is trying to find a service manual before we go any further. He wants to know what the voltages should be in the PA. His power meter is good for 20-300 MHz.

Thanks for your reply.

Burton

From: Roger Sale
Topic: 26329 Message: 26333

Hi Catherine,
This is an odd situation, the only commonality according to the user pdf. is that 50MHz requires NO radiating element connected, and for 28MHz it says 2, 1, or no connection. Have you tried this configuration? Especially the "no elements connected part"

Subject: [FT897] High SWR on 6 and 10 Meters w/ATAS-25

I'm at wit's end on this one.

My 897d and ATAS-25 work great on all intended bands except for 6 and 10 meters. I've tried every possible configuraton of the ATAS-25 and spent about two hours trying to find the "sweet spot" on the antenna slider in all of the different combinations concentrating on the ones indicated by the manual. No joy. I've tried grounding the base of the antenna, no difference. Moving around to different locations, again, no difference.

I really like the antenna for it's versatility and recently used it to service a community event on 2m and 70cm where it performed like a champ. Net control said I had the best signal in spite of being the furthest sation. WHich seems odd, since the VHF UHF elements are just horizantal wires poking out of the base.

If anybody has used this antenna on 6 or 10, I'd be interested in you input. Or, even if you havent used and you have any ideas to get me up on 6/10.

It's probbaly a loose nut behind the knob. :)

From: bigv316@ymail.com
Topic: 26335 Message: 26335

Hi all

I have had my 897 for about two or three weeks now and love it. I have made contacts all along the south east and into west Texas from my qth in Florida.
Tonight however I set up my Buddipole for 20 meters and started going up and down the band but every time I keyed the mic the radio would try and transmit 2khz up from where I was dialed in.
I checked the manual to see if I had set up split by accident but that would be kind of hard to do. I have no idea what I did but if anyone can give me a clue I would really appreciate it.

Thanks,
Vince KI4HSK

Hi Minto,

Thank you very much for your investigation. You have confirmed my fears, the FT-897D can only run at reduced power after a 100W spike.

I wonder if a fix maybe to apply an external bias voltage on the ACC Jack to use as a fixed ALC voltage? This could be a 9V battery with a potentiometer. This way the output should be reduced from the start. It might even be easier then going through all the menus. In fact, an external box with a momentary DPDT switch, 9V battery, pot., and a three-wire cable could send the rig a "TX request" and an ALC voltage for reduced power all at the same time to make a nifty "tune" button for automatic antenna tuners (ref. ACC Jack, pg. 18 of manual).

There's a SPLIT and Quick Split function. I think the Quick Split is "QSP".
Make sure they're all off.

Might I suggest the US Navy's Electricity and Electronics Training Series (NEETS) modules?

These things have taught countless hundreds of thousands sailors the basics. I used them in the early 1980's to put a high polish on my skills and ten years later I used them to teach sailors in the finer points of electronics. They're dated from 1998 but things really haven't changed in the basics. You can browse though the topics yourself but are likely not going to need all the modules like the synchro motors and radar fundamentals.

These modules are available in a series of .zip files at
http://www.rarmy.com/coleman/neets/

G'day to you all

This is a bit "off subject" but maybe there will be a few good answers forthcoming.

I'm trying to locate a really first class site on the net whereby I can download information, lesson plans etc, at no cost, to form the basis of a good (and I hope ongoing) Basic Electronics Class and basic Homebrewing websites.

I have visited several sites but they all seem a bit too disjointed or lacking in structure.

I would appreciate a link to any good sites our members may have visited and can recommend.

Thanks

Does anyone know of any adapters to adapt aviation headsets to the FT897?

I have such an adapter for my VX-6. It would just be nice to use my aviation headset on the FT897.

Cheers,
W4RVB

On Jun 6, 2009, at 3:50 PM, Larry D. Barr, K5WLF wrote:

I have a Heil Traveler and a Heil ProSet 5. They both work great on VOX with the FT-897D. If you ever plan on using a footswitch or handswitch (rather than VOX all the time) the ProSet 5 is a better choice, since the radio-specific adapter is made for that. WIth the Traveler, you'd have to make your own adapter to accomodate the switch. Or use the switch in the cord which I just didn't find ergonomic. A friend of mine also has a Traveler and he likes the switch just fine.

Neither headset can be called cheap, but they're extremely high quality and reasonably priced.

From: adeymcuk
Topic: 26345 Message: 26345

Hi Ive just bought a 2nd hand 897D and immediatley noticed something when I put it in the shack, when I TX on SSB the voltage shifts from between 12.5v up to 13.8 if I key up on FM it drops to 12.5v, im running it from a small SEC 1223 23amp switch mode PSU which Ive used for a long time on my TS-570DG and never noticed any problems, obviously the 570 doesnt have a voltage indication on the radio, but ive never even had the need to check it as the PSU always appeared to work perfectly

anyone any ideas on this

26348. 857/897 MH-59 Mic Problem

Yahoo group: FT897 (2009)
Date: 2009-06-09 03:41:41 UTC
From: Patrick Morgan
Topic: 26348 Message: 26348

I have a FT-857D installed in my 96 Grand Voyager. I use Hamstick antennas, I use a mirror mount modified with longer bolts mounted to the luggage rack. I ran 1 inch ground strap to the mount and connected the other end inside the van so I didn't have external hole in the body of the van. I am using LMR-240 for coax with silver PL-259's with reducers I have checked for DC short and I don't have one. I'm also using a mfj-945e mobile manual tuner. I have distorted audio with the MH-59 mic and some times a carrier with no audio on 20 meters with the tuner in line and no problem when tuner is removed from the circuit. I have the distorted audio problem with 10 meters and 6 meters. But with 6 meters I am using a 5/8 wave 2 meter mag mount antenna with stock coax on the mag mount and no tuner. The mag mount is a Larson. If I use the stock mic no audio problems at all great sig and audio reports. But if I switch mic's I have distorted audio reports and have gotten multiple reports of RF on my signal. Changing the mic gain has no difference and turning down RF power has no effect. Also if I use the 59 mic and select the mod or pwr meter and tap on the mic it goes full scale with no audio in the mic and on full power on ssb. If I turn the power from 100 to 50 watts the tapping on the mic trick goes away. So my question have ant of you heard about the MH-59 mic's being RF sensitive and if you have how do you fix the mic to keep RF out of it.

From: Alan
Topic: 26349 Message: 26349

I just purchased an LDG YT-100 to use with my 897D and it works very well. It has all of the features of the AT-897 except that it is a standalone unit rather than a bolt-on. So far it has tuned all of the bands that I normally use (10, 20, 40, 80M)with my G5RV Lite antenna and, once the frequency is in memory, tunes in about 1 sec. It can also be used with the FT-857 and FT-100. It's the same streetprice as the AT-897.

Hi i am new to the group please could someone tell me what would be the best power supply to use ie. what rating dose it need

thanks chris M3HYT

26352. Sidekick antenna

Yahoo group: FT897 (2009)
Date: 2009-06-12 14:54:44 UTC
From: Rex
Topic: 26352 Message: 26352

I tried posting to this group with another question but my message never went through so I'll try again with another question now. Is anyone on this group using the High Sierra Sidekick with their 897? If you do use it do you also have the Yaesu box plugged into the radio? I have the 857D in my car with the ATAS and it works fine but I want a radio for the house and the 897 does everything I want.
Any opinions welcome.

26356. Autotuner for FT-897D

Yahoo group: FT897 (2009)
Date: 2009-06-08 00:14:35 UTC
From: flprob
Topic: 26356 Message: 26356

I've just purchased an 897, first new radio ever (all previous were 2nd hand). I am considering an autotuner, specifically the AT-200Pro or AT-100Pro. I am new to this group and not familiar with navigating around the site yet. If anyone has advice on autotuners, or can direct me to where any information has been posted, please help.

My antenna is a Cushcraft R-5 for now, hidden in the woods behind my house (darn antenna covenants).

Thanks,

Hugh W4AND

26357. LDG Z-100 Battery Power?

Yahoo group: FT897 (2009)

26359. FT-897D iddle current

Yahoo group: FT897 (2009)
Date: 2009-06-10 13:39:39 UTC
From: zbinio20022002
Topic: 26359 Message: 26359

Hi!
In July 2007 I've bought a New FT-897D In ☐CON-Spark" Gdynia ☐ Yaesu dealer in Poland.
Some days ago, after I read some articles in the Internet, I decided to check idle current in all steps of TX amplifier.
There is a table with this data:
Device My factory setup

Pre-driver
2SK2596 20mA

Driver
RD01MUS1 (x2) 26mA

Exciter
RD01MVS1 (x2) 104mA (50+54mA)

Final HF+50MHz
2SC2782 (x2) 800mA

Final VHF, UHF
RD70HVF1 1100mA

Because a new service manual for FT-897D there is no available yet, I have a question: if readings from table are correct? Maybe a new service manual is available?

Zbig, SP3RNY

26360. On off switch

Yahoo group: FT897 (2009)
Date: 2009-06-07 16:51:09 UTC
From: riley_75j
Topic: 26360 Message: 26360

It just started, when I turn my rig off the freq display goes blank but it stays lit.
I can turn it on and off with the power supply.
Is the power switch gone bad or something else.
It still works other than that.

26367. RE: [FT897] Loss of CAT port communication

Yahoo group: FT897 (2009)
Date: 2009-06-13 12:46:28 UTC
From: Keith
Topic: 26308 Message: 26367

That appears to be the problem since two independent serial to USB convertors have failed to communicate with the radio.

http://www.tigoe.net/pcomp/resources/archives/avr/000749.shtml

Here is a web page that describes how to monitor the serial port with the screen command. If you have a friend with a PC and serial port you can try to communicate with the 897 as a last resort. I'm sure that the replacement of the board for the CAT connector is the solution so send Yaesu Service Dept an email for more guidance.

I just got an 897 as my first new radio too. Same deal, all used before. I'm using the AT-897 with a dipole cut for 20M. It is an L shape horizontal dipole at about 10M on my roof. My AT-897 brings the SWR down to less than 1.5:1 on 40 through 10M. It gave up on 80 and 6, not much of a surprise. I'm happy and this tuner bolts on the side of the radio rather than being a separate unit. Unless you plan to use the ATU with another radio I'd get the AT-897.

This is a known limitation with the FT897D when listening to the audio via the speaker/headphone.
If you listen to the audio from the 6 pin DATA socket on the rear of the radio there is no issue. Pin 5 is audio out and pin 2 is Ground. This information is on page 11 of the manual.
Good Luck

I have the Yaesu internal power supply with my radio and it does not exhibit the operation you describe. IOW, I push the button on the front to power down, the display and the light both go off. I can then turn it back on using the button on the front. Hope this helps somewhat.

Chris, I'm sure you'll enjoy your new FT-897D. In an earlier message you asked what rating power supply the rig needs. The answer is, at full transmit power output in requires 22 amps at 13.8 VDC. a 25 amp peak load power supply would be the minimum you'd want to use. If you buy an external power supply, make sure you get a power cable to attach it to the FT-897, which uses a 6-pin Molex connector for DC power (it uses two pins for + and two for -).

Yes, you can change power output through the extended menu settings. See the manual (available online) for details. It's Menu Item 75, RF POWER SET. The rig will be shipped with the default settings, which are for max power. 80-6 meters = 100 watts. 2 meters = 50 watts. 70 cm = 20 watts. The Menu Item 75 will set power levels separately for each band, so if you reduce power to 25 watts for the HF bands, that won't change the 50 watt setting for 2 meters.

Thanks for that info. The fuse itself is available from Mouser for 38 cents plus shipping. It's a Surface Mounted Technology device, but with only one solder connection at each end, it doesn't look like it would be difficult to replace. I think I will try that myself before shelling out $100 for their ministrations. It's readily accessible; you don't even have to remove a circuit board

The fuse was good in mine. You can check the fuse by checking to see if
you have power on the pin that it feeds. Mine did and it turnedout to
be a couple of diodes that had to be replaced instead. Of course
diodes are cheap but I couldn't find where they were located.

> I have a FT-857D installed in my 96 Grand Voyager. I use Hamstick antennas, I use a mirror mount modified with longer bolts mounted to the luggage rack. I ran 1 inch ground strap to the mount and connected the other end inside the van so I didn't have external hole in the body of the van. I am using LMR-240 for coax with silver PL-259's with reducers I have checked for DC short and I don't have one. I'm also using a mfj-945e mobile manual tuner. I have distorted audio with the MH-59 mic and some times a carrier with no audio on 20 meters with the tuner in line and no problem when tuner is removed from the circuit. I have the distorted audio problem with 10 meters and 6 meters.

(trimmed)

http://groups.yahoo.com/group/FT897/message/22145

Rob W1AEX has a good writeup of the problem and solution:

"1. The 857/897 rigs seem to be somewhat susceptible to RF feedback issues. Users will sometimes experience RF in the audio, or in extreme cases, the rig may reset, or shutdown, or break into oscillation, or scramble its service menu settings. Using the optional MH-59 microphone can sometimes bring these symptoms on with a vengeance. Note that Dean Gibson, AE7Q, engineered a nice fix for the MH-59 microphone which he has posted on his site at:

http://www.ae7q.net/doc/public/MH-59.php

The fix for all this is the usual stuff: Establish a good short path to a common station ground for all the equipment attached to the radio. Use ferrite on leads that are picking up RF if the problem continues. Keep the radio out of near-field RF from the antenna. I've never seen an issue with the 897D when it is installed following good station practices."

Yah, of course I'll do that first -- 13.8VDC on Pin 1.

I would not be surprised if the fuse isn't the issue; the 13.8VDC doesn't power the CAT port circuitry itself, only Pin 1. I don't know whether or not the CT-62 dongle uses that 13.8V or not; I can't find a schematic for it in the Technical Supplement materials.

Chris, the FT-897, when set to 100 watts, in SSB mode draws about 6 amps average, with peaks around 10 amps. In CW about 15 amps.

A Samlex SEC-1223 will power it without strain. I know several hams using these, including our club president's station.

http://www.universal-radio.com/catalog/hamps/3747.html

This link shows the USA version, 120 vac / 60 hz. But I found this link to the European version, 230 vac / 50 hz.

http://www.samlex.com/pdf/products/powersupplies.pdf

The 1223 is rated 23 amps continuous, 25 amps surge. I don't think I'd use any power supply with a rating less than 20 amps continuous.

I have the Samlex SEC-1235M, 30 amps continuous/35 amps surge, which is a little overkill, to power my Icom 718 and Yaesu FT-2800M. I bought it mostly for the meters.

http://www.universal-radio.com/catalog/hamps/1235.html

These two Samlex models are "switching" power supplies and are quite small and the price attractive.

In my FT-897 I have the Yaesu FP-30 power supply which replaces the bottom case cover and makes for a nice one-piece unit.

http://www.universal-radio.com/catalog/hamhf/45431897.html

I understand some of the early FP-30's were noisy but they have since modified them to remedy that. Mine is actually marked FP-30b. The main complaint of these is their cost, which is about double that of other power supplies.

I'm sure others will chime in with their favorite supplies.

Paul - AE5JU

26380. Re: [FT897] Display voltage changing

This is not unusual. Since you're still getting 12.5 volts at maximum draw, you're okay; if it drops below 12 when transmitting, you would want check your connections and your cabling.

Any power supply will and should have some voltage drop as the load increases. With no load, you're seeing the terminal voltage of the supply, and as the load increases, the voltage will start to drop. Voltage and amp draw are closely related; voltage is pressure and amperage is flow. With little or now current flow, the electrons are pressing against the negative terminal with 13.8 volts of pressure. As you draw some of those electrons off by increasing the current flow, the measured voltage will go down. The more amperage capacity you have, the less pronounced this effect will be, but any finite power supply will show some voltage drop as the load increases.

That's one reason I try to run 50% or more over capacity on my power supplies; the more headroom you have, the more stable your voltage will be.

You can also minimize this by making sure you're using the right connection equipment. I use spade connectors, similar to these:
http://www.radioshack.com/product/index.jsp?productId=2103477
Rather than just crimping the connector to the wire, I soldered it on, ensuring maximum current flow. Using the spade lugs, rather than just wrapping the wire also allows me to quickly remove the radio for transport.

From what I've heard, the TS-2000 has a noisy receiver, a natural consequence of being a "compromise" rig.

Personally, if I was going to spend that kind of money (I think the TS-2000 goes for $1300-1400), I'd get an FT-450 for HF and get a separate rig for UHF/VHF: Probably an FT-8800 or 8900. The FT-8x000 series radios have dual receive, cross-band repeat, and if you have two radios, you can monitor repeaters while still working HF.

Rex, are you a new member to the group? The administrator moderates the first couple of posts for new people, so sending the same post 2 or 3 times won't get it thorough any faster, and it will annoy the moderator who has to read and approve the messages. (I run some other groups, and I have the same issues...) :-)

Yes, this radio mutes the receive when you tune it through HRD. There is currently no workaround. This problem (and the genreally lousy CAT support), is one reason I've given up using this radio for CAT.

However, all is not lost. You can still scan using the microphone or the front-panel scan feature, and you should also check out the SCOPE function. Much more useful than scanning.

Interesting to hear another power supply question. :)

At a bare minimum, you need at least 23 amps. However, you might think about something in the 35-40A range. If (when) you get more radios later, you can simply run them all from one supply. Also, the bigger your power supply is, the less likely you are to have problems, and you'll have a more stable supply voltage.

My Z-11 Pro can be operated from AA batteries. the manual even tells you how to connect an internal battery holder. All I'd need to do is get an 8 AA holder and solder the wires to the two open solder pads near the power connector.

You can also reference the manual at http://www.hsp.it/radio/ldg/Z-100/Z-100_manual.pdf

You can also use the LDG "one touch tune" interface. This will power the tuner and let the tuner key the radio for tuning.

You should also turn your SSB mic gain down: I set mine at 10. With the dynamic mic, it had been set at 100.

You can also enable the speech processor, although I haven't noticed any real difference with mine. It's one of the soft-buttons, labelled PROC.

From: K.Greenough
Topic: 26347 Message: 26389

Hello Aidrian,
If I've read your mail correctly you're saying that
the voltage reading goes up when you Tx SSB.
This could be that your RF is effecting the PSU,
you could try monitoring the voltage [at the rig end
of the cable if possible] with a known good meter,
preferably one you know is not effected by RF.
If the voltage is indeed rising then I think it's almost
certain that RF is upsetting the regulation. If the
external meter shows no change but the 897s front
panel does then it could be RF effecting the radio
or it has a fault. Have you tried using a dummy load?
If all is well using a dummy load then stray RF is the
problem, if the volt reading still goes up then there is
a fault with the sets metering.

Hello Patrick,
Two points, first you could feed the mic cable through
a ferrite ring a couple of turns at the radio end of the lead.
Secondly, taking your ground strap to the inside of the
vehicle probably destroys the shielding that the car body
would normally provide.

Hello Chris,
You really need a 25 amp supply to be able to deliver SSB without the voltage dropping. That's at 100 watts output, with your M3 call running 10 watts you can get away with a much smaller PSU, say 10 Amp, but it's best to get a supply that can power the rig when you progress to 100 watts. For a linear supply I recommend the Manson EP925 which can give 25 Amps constant and 30 Amp peaks. Switch mode PSUs are much lighter but can cause interference to your receive and can be affected by RF when transmitting.

Aidrian,
I forgot to say that winding the supply lead through a ferrite
ring a few times at the PSU end could filter out any RF
being fed into the PSU, or a clamp on ferrite.

From: George
Topic: 26308 Message: 26394

I've seen several comments concerning a SMT fuse on the CAT port, and was wondering if there was a similar one(s) on the DATA port. I have recently lost the audio out from that port that I was using to input into a PC thru a Rascal soundcard interfact when using APRS. I can barely get any signal (not enough to be recognised by the PC program) from the port even adjusting the respective volume controls all the way up. Nothing else seems to have been effected.

Ben,

I don't have a K3, never even used one. I do own an 897D (similar to 857D). I looked at the spec sheets I downloaded for the 897D and K3 when I was studying prior to purchase. The noise floor and sensitivity numbers are pretty similar (as they are for most rigs). I strongly suspect that the antenna you use will be much more important to your receive ability than and difference between radios. If you found a good deal on some used 857s, I would probably jump at that while it lasts. I doubt you'll be disappointed. They are great radios. I went with the 897 because in this case I was specifically looking to take it portable.

Good luck.

From: C. Griffin
Topic: 26355 Message: 26396

Unless you have severe space considerations, I don't think the 897 is really the perfect choice for home use. It's really designed to be a portable rig. I have a TS-2000 at home and am very happy with it. With respect to the other comment that the TS-2000 is noisier, I'm not sure that the specs bear that out. The sensitivity for both receivers is 0.20 microvolts. On 14MHz the noise floor for the 897D is -132.6 dBm while it is -129 dBm for the 2000 (larger negative numbers are better). Those are pretty close. Certainly the 897D is better, but it's pretty marginal difference. I have the numbers for other bands if interested, but again they are pretty close. The biggest difference is on 2m.

The FT450 has lower sensitivity on HF SSB than either the 2000 or 897 (0.25 microvolts versus 0.20). The noise floor for the 450 is substantially worse on 160m but is pretty similar for the other HF bands.

From: Thomas Wilson
Topic: 22707 Message: 26399

The K3 is an $1,800 radio, and the 897 and 857 go for around $800. Just looking at the K3, it seems to be in a whole different class. If I was considering the K3, I wouldn't even be looking at little mobile radios like the 857's, I'd be looking at mid-range rigs like the FT-950 or IC-756.

In the case of 80 meters, a more sensitive receiver isn't going to help cut through the noise. In fact, it could have quite the opposite effect. I find that on 80 and 40 meters, I get the best results with my attenuator turned on - making my receiver *less* sensitive.

On the other side of things, a good set of IF filters can help when working crowded band conditions: PSK on 40M, for example, gets pretty crowded, and having the right filter should cut down the stronger transmissions that mask weaker ones in the same 3 Khz area. That's probably the weakest area in the 897, and it's something I need to address somehow in the future.

26400. Re: Autotuner for FT-897D

Yahoo group: FT897 (2009)
Date: 2009-06-15 17:26:29 UTC
From: ve3wmb
Topic: 26356 Message: 26400

Hugh :

I am using the LDG AT100Pro with my FT897D at my cottage station. I am using this setup with a double-sized G5RV (i.e. 204 ft long) fed with 60+ feet of ladderline, a 1:1 balun and about 10 feet of LMR400 to the tuner. I mostly operate QRP CW and this setup works very well for me. The tuner easily matches this antenna from 160m through 10m (6m is a bit iffy) and the efficiency seems to be good.

This is the third LDG I have bought (I also own an Original QRP Tuner and a Z100) and I have been very pleased with the reliability of the LDG products. I really like the AT100Pro.
With the auto-tune capability it only takes a short transmission to trigger a retune when changing bands etc. I also like that fact that this tuner has a built-in antenna switch and supports two antennas which separate tuner memories for both antennas.

Cheers,

Michael VE3WMB

Most rigs are a compromise unless they are single banded...I have both
the 897d and a TS2000...theres no comparison...The TS2000 is a much
nicer quieter, more capable radio...The 897 is a great radio but it is
much noisier and don't forget that most of its functions are buried in a
menu...I like both but for different reasons...

Upon trying to transmit on 52.125, USB, my display showed, "29.600 FM". When I released to PTT, the display returned to 52.125, USB.
New rig to me, any suggestions?

Agree 100%. My TS-2000 is my home rig, my first HF rig, and is quite capable and I am very happy with it. My FT-897D is my third rig. I purchased it for a portable station, something I could take to the beach or a mountaintop. So far I am very happy with it, but I am still assembling the station (I just ordered a YT-100 tuner). This July I will be at my wife's family cottage for a week. I'm looking forward to some HF work in the evenings for entertainment. (The family rule is no TV at the beach house, except for an occasional Red Sox game or weather check.) Look for me portable in MA this summer.

I just ordered mine from HamCity for $174. I used up some of the savings with 3-day shipping. Hope to have it by the time I come off night shift so I can do some more experimenting with the station later this week. Perhaps a test trip this weekend ...

Look to see if you have the split function enabled. A "SPL" will be displayed on the screen if you are in this mode. This is normally used when you have a pileup and a station is transmitting on one frequency but listening on another. Very useful in such situations. It can also be used for satellite operation, which is often on different bands. See page 38 of the manual for more details.

Thanks for the input, guys. The guy I talked to about it here had the opposite to say, but then there are many reasons that could be the case: bad antenna, bad unit (hey, it happens!), or just a bad operator. :)

I'll have a chance to compare my 897 side by side with a TS-2000 at Field Day; the PSK station is going to be a TS-2000 rig.

The one thing I DO like about Kenwood is that their CAT integration; you can do everything on the rig via CAT, even control the volume. This makes it much simpler to operate remotely, and I'd like to be able to set up a remote station someday.

I'm going to have to respectfully disagree. I have the 897D as a home rig, it's compact, and lives on my desk in the living room. Add Ham Radio Deluxe and you have all the ease of control that you would have with a big "base" radio, and the flexability to take it into the field on short notice. (I suggest you add powerpoles to the power cord, and you can easily transfer it to a car if needed) If your desk has room, add the MD-100 desk mike and you have a very flexible, and compact station.

26408. Re: [FT897] Data Port fuse

Yahoo group: FT897 (2009)
Date: 2009-06-15 20:02:20 UTC
From: Lew Phelps K6LMP
Topic: 26308 Message: 26408

I've looked at the circuit diagram, and there is no fuse on the DATA port. The CAT port provides +13.8VDC on Pin 1, and that's the line where the fuse is located. the DATA port doesn't provide supply voltage on any pin, and hence has no fuse. In fact, according to the parts list in the Tech Specs, the CAT fuse is the ONLY fuse on the entire main circuit board. I don't know if the Yahoo system will permit it, but I have attached a screen shot of the relevant portion of the circuit diagram. Nothing but caps and resistors on the DATA port lines. You might want to try measuring the resistance to ground from each of the pins, and/or pop the lid and measure the resistance across the individual components. They're located on the top side of the main circuit board, right next to the DATA jack itself.

These little SMD fuses cost about 50 cents each, and even investing in a $12 tool designed to remove SMD components, and a tiny new tip for my soldering station, I will be 'way ahead of the cost game by replacing it myself.

And by the way, for those who posted earlier on this topic, the fuse is definitely blown. No voltage on Pin 1, and no continuity across the fuse. So I am going to replace it and see what happens. Worst case, if there's something else wrong on the board, the fuse blows again, and then I have to ship if off to Yaesu.

It will be a "learning experience" for me, since I have never worked with SMD components, but there are some good video tutorials online for how to do so, and there's a cheap ($12) kit designed to remove SMD components at low temp (300F), so as not to damage the circuit board.

Thanks to all who contributed to this discussion.

I bought the 897d last Fall, and it is a nice radio, but navigating the menus is a problem without HRD. In Feb I bought an IC 7436 PRO and there is no comparison between it and the 897. Much less noise on receive making it easier to listen to, and fewer menus to run through. I still have the 897 for a second radio, the 897 has more bands though

If it blows again, I would suspect you have a short external to the rig. A bad cable or something. Check those out for intermittent shorts.

From: Dave Nelson
Topic: 26413 Message: 26413

Rex,
there's no comparison between the 2 radios, they are so
different
in so many ways especially in price!!! 897D AU$1100 TS2000 AU$2500
and $3000 is you get it with 1296 installed
that is another great feature of the TS 2000 ... the 1296 option
If I had the money I would buy the TS2000X (1296 version) today !

I use a 897D for base station and have done so for 4 years its a great radio

it really depends on your budget if you have the money to easily buy a
TS 2000 go for it, if like me, and its not in your affordibility then
the 897D will
serve you very well

So if I buy the CAT cable (new USB Version from RT Systems) and I tune via HRD on the computer, I will lose audio from the PC as well? I assume I could still tune via the front radio dial and this would not happen? My goal is to run a cable from the Ext. Speaker to the line in on my PC. I like the audio going through my PC. I still TX via the headset connected directly to the radio since I don't like to mess with setting up a rig blaster.

What about running audio from the Ext. Speaker on the back of the radio to the input on your PC, would that cause the audio to be lost as well while tuning?

Rob

26415. Anyone willing to share some screenshots of HRD with your 897D??

Anyone willing to share a couple of screen shots if possible to look at how its set up. I am told that it virtually eliminates the menu system and places the options right on the screen. I am trying to decide if its the way I want to go. My email is HKUSP.40CAL at GMAIL dot com.

Thanks all,

Rob

I agree, the 897D (and I really enjoy mine as a portable radio) isn't really intended to be a main radio (or at least it isn't what I'd select). My Pro III is much easier to listen to and just a better radio. The 897D's audio is not all that pleasant.

But, as a radio to take along for use in cabins and remote locations ... it's perfect for me.

I'd select almost anything else as a main radio or, if I had to have just one radio ... even my ancient TS-830S runs circles around it.

I love the 897D for grab and go - I have the add-on power supply, so I can literally put it in a suitcase along with a dipole and have a radio in remote locations. It's perfect for that and - my opinion - that's what it was intended to be, a radio that is serviceable as far as operation.

I bought the 897d last Fall, and it is a nice radio, but navigating the
menus is a problem without HRD. In Feb I bought an IC 7436 PRO and
there is no comparison between it and the 897. Much less noise on
receive making it easier to listen to, and fewer menus to run through.
I still have the 897 for a second radio, the 897 has more bands though

The audio just blips momentarily - and only when using HRD to tune.

If you use the dial to fine tune, there's no issue.

But don't hook the ext speaker jack directly to the PC. Use a ground loop isolator - keeps hum out of the PC and RF out of the radio:
http://www.radioshack.com/product/index.jsp?productId=2062214

Also, the DATA jack apparently does not have the problem. You can build a data adapter with a PS/2 cable; I just lopped one end off and directly soldered wires to the RCA plugs at one end of the ground loop isolator. The other end goes to the line out and line in ports on my external Sound Blaster.

Check out the web site: http://www.ham-radio-deluxe.com/

The program is free. Does control, logging, and has bundled programs for DX Cluster, digital modes, and a few other odds & ends. You can test it out without a radio connected; you select a radio emulator from the connection menu.

I've not had this problem with mine. I am running my radio at 38.4Kbps between the rig and PC though. The default is 4.8Kbps. You may want to up the speed of communications between the rig and PC so that there's not so much waiting as commands are exchanged. You'll also notice that HRD responds extremely quickly when you are running nearly 9x faster than standard

From: FT897@yahoogroups.com [mailto:FT897@yahoogroups.com] On Behalf Of Aristotle Zoulas

To: FT897@yahoogroups.com
Subject: [FT897] Anyone use this radio with HRD

Hello, I am having a problem where when I move the slider on Ham Radio Deluxe, there is a momentary mute of the sound (about 1/100 of one second). Its enough to be a problem as I cannot continuously change the frequency to tune in a station. Works fine from the radio. I posted a similar question on the HRD group and a few people said it was a common problem with the FT-857/897. Some people said they had to sell their radio because of this problem as they liked the program so much.
Any Help, thanks

Aristotle Zoulas, Warwick, NY.

I agree with you. The 897D makes a great "base" radio especially for someone new to the hobby (like me) who's looking to get the most flexibility out of one radio. I choose the 897D is my first HF rig because of its flexibility as a base/portable/mobile unit.

I don't find the menu system too bad, but then I'm used to Yaesu radios so I know what to expect. Most of the settings you want to tweak can be accessed through shortcuts. For those of you that didn't read this in the manual or accidentally find it, pressing and holding a menu key usually takes you to the appropriate menu mode to modify the related setting.

My 897D is setup with the FT897 autotuner and a RigBlaster Plug n Play along with HRD for rig control and digital modes. I plan on adding the internal batteries and the collins filters in time.

In time I will add a better HF base rig, as well as a real mobile VHF/UHF radio to my shack, but in the meantime the 897D is it.

>> I tried posting to this group with another question but my message never went through so I'll try again with another question now. Is anyone on this group using the High Sierra Sidekick with their 897? If you do use it do you also have the Yaesu box plugged into the radio? I have the 857D in my car with the ATAS and it works fine but I want a radio for the house and the 897 does everything I want.

Rex, here's an ATAS interface box:

http://www.w4wb.com/BOSS/Antenna%20BOSS.htm

It says temporarily discontinued, but that does mean that there's at least hope. :)

I use my 897D as my only HF rig, and keep it at home on my desk. My previous rigs were a Kenwood TS-520SE and a Drake TR-4C, so it's safe to say that this is a big upgrade for me.

I am extremely happy with my 897D. I live in a deed restricted townhome, so my antenna is limited to a 15' dipole in the attic surrounded by A/C ducting that is being tuned with the LDG AT-897. This is far from a great setup, but when the bands open up, I consistently hit South America, Europe, and various MMRN net controllers from Florida. I am getting good signal reports and usually keep the power at 50 watts. I am also learning how to use HRD and DM780 for the digital modes.

I'm not sure if this radio is quiter or noisier than others, but this radio is a 100 Watt DSP CAT radio with full HF, 6M, 2M, and 440. For the money, I don't know of a finer rig with so much included. And while I like having more knobs/buttons than menu's, I really don't have a problem with the menu's. I have a cheat-sheet sitting on my table that I use for the rarely changed menu settings.

This radio is no FT-2000 or IC-746, but it is also under $1000 with the LDG AT-897 and FP-30 power supply.

73,

de Hank / KB4MTO

I guess I have to feel guilty about using my 897 in ways it was not intended to be used--as my main HF radio.

I have experience on the Yaesu 450 and find the 897 superior in most respects. For instance, I find the filtering on the 897 to be superior.

By whose ruling was the 897 not intended to be used as a main rig? I hate having these arbitrary rules imposed. Use your 897 as you want and don't you dare tell me that I am not using my 897 as it was "intended to be used."

I bought the 897 because I thought I might need to operate portably in order to make DX contacts. I lived in a New York City apartment building with no balcony and no way to mount an outdoor antenna. My fallback would be to head into Central Park and work portably. As it I am using an antenna the apartment and just worked my 42nd foreign country tonight.

It is my base station and I am delighted with it. And if I am not using it as God intended me to, tough nuggies.

There's sure no rule against using it as a main rig. I'm just saying that - for me - it wouldn't be the radio I would choose as my main rig.

The neat thing about radio is that we get to pick the equipment that suits us best.

Again, I'm glad I have the 897D - and am sure not intending to detract from it. It's just that - for me - it works best as my portable rig. I enjoy - just from the way it sounds and works - the Pro III more as my main rig. And that even my very old TS-830S outperforms (no charts, no specs here ... just how it feells) the 897D - it's a joy to listen to, easy to operate.

On the other hand, I can't imagine packing up my main station - as I do with the 897D - and taking it on the road. I won't part with the 897D until something comes along that does that job better at a price that I can afford to pay.

None of this means that I'm 'right' ... just means that this is what works best for me. I don't see how a person can go wrong, in fact, as long as they're using a radio that they enjoiy.

I have experience on the Yaesu 450 and find the 897 superior in most respects. For instance, I find the filtering on the 897 to be superior.

By whose ruling was the 897 not intended to be used as a main rig? I hate having these arbitrary rules imposed. Use your 897 as you want and don't you dare tell me that I am not using my 897 as it was "intended to be used."

I bought the 897 because I thought I might need to operate portably in order to make DX contacts. I lived in a New York City apartment building with no balcony and no way to mount an outdoor antenna. My fallback would be to head into Central Park and work portably. As it I am using an antenna the apartment and just worked my 42nd foreign country tonight.

It is my base station and I am delighted with it. And if I am not using it as God intended me to, tough nuggies.

I also have to respectfully disagree with some of the negative comments about this rig. It makes a very capable home rig for the money. No it won't comapre with the bigger rigs, but then it doesn't cost as much.

The business about the menu system is a non-issue as far as I'm concerned. By far most of the menu items you select once and never touch them again. In fact in our club we have several FT-897 owners who have complained about the menu situation. Yet when I sat them down in front of their radios and asked them "specifically" to show me what was so horrible they could not do so. Turns out that them complaing about having to step through all the menues wasn't true. It seemed to me that some of these people had more fun from complaining about the rig then actually using it.

Yes, there is fairly extensive menu on the FT-897. No you will not have to touch the vast majority of them after you have set them. In fact a lot of them you won't have to touch at all. Once you get them set you forget them. If you think that will bother you then this radio is probably not for you. Go for a bigger rig that has a bazillion buttons on the front, a lot of them being multifunction, and tell me if it's more fun. In fact one of the complainers in our club has a "big" Yaesu rig. I sat in with him one day and it took him longer to figure out the front panel of his big rig than his FT-897. Go figure. Also I will go on record as saying I don't think you even need to use HRD to operate the radio. Maybe if you want to enter a lot of memories yes, but to just operate the radio - nope. you might like to use HRD, and you might find it fun, but it is not necessary.

One other plus for this radio is that it is all bands, all modes. Well almost as it doesn't cover 220 MHz. My friend just bought a VHF/UHF rig that also had 10m and 6m, but only if FM mode. What a waste because around here there is next to no FM on 10 and 6. With the FT-897 I've had a ball working sideband on 6m and also 2m and 70cm. In fact after talking some of the local hams into getting on and trying 2m sideband almost every one of them said it was the most fun they've had in a long time on 2m. That it was more like real ham radio.

And the FT-897 makes a fine portable rig. I've taken mine up north with a Buddistick antenna and worked all sorts of great DX (of course that was way back in the day when we still had sunspots!).

Eventually someone will come out with a better all band all mode rig, but for now the FT-897 does a fine job. Good luck.

(usual disclaimer - just an owner, etc. etc. etc.)

Very well put, John. I have two FT-897Ds in my shack. One of them stays here all the time and functions as my one and only main base radio. The other one is ready to grab if I need to deploy on a drill or actual emergency.

The base radio is fitted with an LDG AT-897 tuner and I'm currently using an LDG Z-100 with the 'grab it and run' unit. I'll be putting an AT-897 tuner on it very soon. The convenience of having a wide-range tuner bolted to the rig is outstanding. Especially when operating portable.

You're totally correct, John, about not needing to change the majority of the menu settings once the radio is set up. And with a little practice you can navigate the menus you do change with ease.

I've talked around the world with my FT-897D running 'barefoot' into a Hustler 5-BTV mounted on my metal roof. I also have a Buxcomm 8010CD folded dipole strung at 15' in a shallow inverted-V configuration for NVIS (cloud warming) operation. The radio does everything I need it to do.

Would I like an FT-DX9000D? Heck, yeah! But I don't *need* one. The 897D is doing a great job.

I also agree that you don't need HRD to run the radio. I just downloaded it tonight and I'm gonna try it. I don't need it, but being a gadget freak, I'm going to give it a try. Looks like fun.

Don't let the menus keep you from enjoying a fine, versatile radio.

The FT897D is a howling bargain for what it does. I have a Mark V and an FT897 (late model, non-D) and while the Mark V is fantastic, the 897 does very well and I enjoy using it.

The FT897 is fantastic with HRD/DM780. Enjoy.

I got the 897 beause I wanted a DC to Light radio as my base unit. I didn't have anything that would cover 70cm, other than an FM HT. I also wanted a unit that could be taken in the field so I can opperate from the waterfront and take advantage of the saltwater groundplane. I live 3 miles from a 50kW clear channel AM station and on my Icom 706 MKII 80M was wiped out. So I need to get away from the home QTH to opperate 80M. I also wanted it for digital modes. I'm using the Tigertronics USB sound card interface and it works great. I am still outfitting my radio, I just got it at Dayton. I will add the Collins filters and build my own custom LiFe battery pack. My first impession of the radio when I turned it on, on HF, was a lot of background noise. It could be band conditions, my inexperience with HF rigs or a lack of a sharp filter before the last detector. Either way, this will not be my only radio. Hey! What do you expect for less than $1000? My next rig will be the Flex Radio 1500. I know SDR will be the design of the future and I am going to get in on the ground floor as best I can.
Right now I'm happy with my decision.

I find comments that the Ft897 is noisier than other radios very hard to believe, especially on the lower HF bands where the noise floor is limited not by the radio, but by the external noise coming down the antenna!

I have compared by 897 with several other radios including an IC7000 and an Ft1000 and the noise floor is virtually identical. What can be slightly different is the tone of the noise coming from the different radios. This may be down to speakers or audio stage frequency response.

It is interesting to use the IF Shift on the 897 to move the pass-band slightly, you can in most cases make the radio sounds pretty much the same as the one that you are comparing it with.

probably not much help but a lot of radio have a tx shift along with a RIT. I have not seen a tx shift on the 897 but that does not mean it isn't there. If all else fails try doing a reset.

26437. Audio quality (Using the 897D at home)

Yahoo group: FT897 (2009)
Date: 2009-06-16 13:13:35 UTC
From: wa0lhb_john
Topic: 26437 Message: 26437

Hi All,
I have my 897D set up in my shack along with several other rigs and find that it really is quite a good rig and compares quite nicely to my FT-950 in many ways.

I have the audio output from both rigs connected to an extra pair of hi-fi type speaker. One of the first things I noticed about the 897 is that the audio is rather shrill on SSB and that there are a lot of annoying off channel chirping and burping sounds coming through (loose IF bandpass filtering). I discovered that by adjusting menu item 47 [DSP LPF cutoff] down from 6 KHZ band pass to 2.4 KHZ band pass and menu item 46 [DSP HPF cutoff] up from 100HZ to 240HZ the audio is much easier to listen to on SSB. Note that these settings affect the audio electronics portion of the radio and will apply to NFM and WFM RX as well. I don't know if the DBF settings affect TX audio but suspect that they don't.

As far as the internal speaker goes.... well that's why I prefer to use an external speaker.

From: Charles Scott
Topic: 26355 Message: 26438

All:

I find both of these reports to make sense. One is a person who lives close to an AM broadcast station and who is experiencing wide-band noise problems. The other, while they don't say whether there's any significant AM broadcast transmitters in the area, does not have a noise problem. The reason this makes sense to me is that it's consistent with a problem I diagnosed on my 897 a couple years ago.

The problem, at least with my radio, is that strong signals on the input can drive the switching diodes on the input into a non-linear range. The net result is considerable wide-band noise that extends, in my case, well up to 15 MHz and in a few places copyable replicas of a local AM station. I measured the total voltage at the shack end of the transmission line when connected to my beam, and it's a bit over a volt. I live 2 to 3 miles from 3 AM broadcast stations. This is not a problem on any other radio I've used at my location. The problem is likely due to inadequate bias on the RF switching diodes (that route RF on the receiver input) when either on or off.

The reason that I know this is what's happening with my radio is that adding attenuation to the input dramatically reduces the noise relative to good signals. Turning the preamp off and selecting the attenuator only reduces both the noise and the signals the same amount. This means that the noise is being generated at the input and before the attenuator. In the 897 there's several sets of switching diodes that could be responsible for this.

At the time I noticed this my scope was ailing and not up to diagnosing this problem. I now have one that can do this and one of these days I'll get into the radio to see what's really going on. (If I ever get through the stack of other stuff that needs attention.)

If this is a chronic problem with the 897, it would explain the vast differences in how people rate the radio and specifically the complaints about more noise than other radios. It's also not something that would show up in bench testing unless the tech was specifically looking for this kind of problem. How much one ham is affected vs another of course depends not only on their proximity to strong signal sources, but also the design and placement of their antennas.

From: n3zjy
Topic: 26308 Message: 26439

I had my SMT fuse go a while back on my ex-857D. The CAT cable wire pulled out of the serial plug and shorted. The newer cables from G4ZLP only use 3 wires instead of 4. It doesn't need power from the rig so no possibility of shorting. So if you don't need power from the rig to control a Yaesu screwdriver, then that's the solution for you.

Subject: Re: [FT897] FT 897 Help

Chris, I'm sure you'll enjoy your new FT-897D. In an earlier message you asked what rating power supply the rig needs. The answer is, at full transmit power output in requires 22 amps at 13.8 VDC. a 25 amp peak load power supply would be the minimum you'd want to use. If you buy an external power supply, make sure you get a power cable to attach it to the FT-897, which uses a 6-pin Molex connector for DC power (it uses two pins for + and two for -).

Yes, you can change power output through the extended menu settings. See the manual (available online) for details. It's Menu Item 75, RF POWER SET. The rig will be shipped with the default settings, which are for max power. 80-6 meters = 100 watts. 2 meters = 50 watts. 70 cm = 20 watts. The Menu Item 75 will set power levels separately for each band, so if you reduce power to 25 watts for the HF bands, that won't change the 50 watt setting for 2 meters.

From: Ben Ramler
Topic: 17604 Message: 26441

Evening everyone,

Question. I have a deep cycle marine battery here at the house but I don't know anything about the battery.

here is what it says on the outside of the battery. part# is HD24-DP. Cranking at 32F is 505. Resevere capacity is 100.

based on what I have just said does anyone know what amps this battery is?

73,

Ben

Yes. I used 2 9V battery leads put together in series , and soldered one end to ground and the other to the B+ of the power plug. Works just fine. I also used a thin piece of foam to keep the batteries from being lose inside the case. I just set them on to the relays. If you want a picture of what I did I will send it. Amie N9OXO

Hi Thomas

Thanks for that, nothing to worry about then, it's the first radio ive had in 30 years with a Voltage indication on the disply, I sort of suspected what you said but had wrongly assumed that being a mains PSU that as the load increases the Voltage would remain a constant 13.8, agreed on the going overboard as far as rating is concerned, its purely on a cost basis im using the little Samlex, when funds allow I will look at a better PSU, thanks again for the excellent explanation

Adrian

Subject: Re: [FT897] Display voltage changing

This is not unusual. Since you're still getting 12.5 volts at maximum draw, you're okay; if it drops below 12 when transmitting, you would want check your connections and your cabling.

Any power supply will and should have some voltage drop as the load increases. With no load, you're seeing the terminal voltage of the supply, and as the load increases, the voltage will start to drop. Voltage and amp draw are closely related; voltage is pressure and amperage is flow. With little or now current flow, the electrons are pressing against the negative terminal with 13.8 volts of pressure. As you draw some of those electrons off by increasing the current flow, the measured voltage will go down. The more amperage capacity you have, the less pronounced this effect will be, but any finite power supply will show some voltage drop as the load increases.

That's one reason I try to run 50% or more over capacity on my power supplies; the more headroom you have, the more stable your voltage will be.

You can also minimize this by making sure you're using the right connection equipment. I use spade connectors, similar to these:
http://www.radioshack.com/product/index.jsp?productId=2103477
Rather than just crimping the connector to the wire, I soldered it on, ensuring maximum current flow. Using the spade lugs, rather than just wrapping the wire also allows me to quickly remove the radio for transport.

I also ran an 897 side by side with a 7000 for about a month. Several friends had sun the praises of the 7000 over the 897, but that is not the case - especially in a fixed installation. Both radios were connected to a coax switch so I could swap radios between the same antenna. Except for 6 meters, this antenns was a 170' long wire up 90' over water. I could get virtually the same filtering effect on the 897 as with the 7000, and the perceived signal was almost always clearer on the 897 than the 7000. The noise floor here in the city is very high, but was easier to manage on the 897 than the 7000.

Once I installed the 7000 in the truck, I have been very pleased with its performance. This is the environment it is best suited for. Here it is connected to a series of Hamsticks through an LDG tuner, and the performance is outstanding.

Ben,

The K3 is a totally different animal. It can have dual receivers, roofing filters, DSP at the IF level, lots of features not available in less expensive radios. There is even a panadapter available for the K3. I own an FT-857 and a FT897. I wanted a high quality DX radio so I looked at the K3 after hearing them on the air and reading the rave reviews. Some serious DXers are giving up their FT-1000 radios for the K3.

The basic K3 starts at $1849.00 in kit form. By the time you add an internal antenna tuner and other accessories you are in the $2600.00 price range. I decided to sell my TS-2000 (Kenwood), keep the FT-857 for mobile use, the FT-897 for portable use and buy a FT-950 for my shack. So far it has been a fantastic radio, and seems to hear much better than the TS-2000 did. I could have purchased two FT-950 radios for the price of one K3. So, yes I did put a price limit on how much I was willing to spend for a radio. As the saying goes, different strokes for different folks, they even make $10,000.00 radios if you want to spend that much.

If you are considering the K3 take the time to read the reviews on eham.net. The FT-857 and FT-897 are great radios, but I do not feel they are in the same class as the K3.

26447. Help with counterpoise & 80m wire questions and advice please ?

Yahoo group: FT897 (2009)
Date: 2009-06-15 13:10:55 UTC
From: simon.worsley
Topic: 26447 Message: 26447

Gentlemen and ladies

Very warmest wishes from London !

Firstly, sorry for being off topic and thanks for the bandwidth! I do own an FT-897D (see my other posts)

My station call is G7IVJ just getting back on HF again after a few years of non-HF

I have a few questions relating to my 10m to 160m wire antenna made by www.k1jek.com it is the 140 foot version, which is made of 420 feet of wire and should work 10m through 160m. It is installed at 38 feet to the centre as an inverted V, and each end drops to about ten feet off the ground. For a better description about the antenna take a look at: http://www.hamuniverse.com/cobraantenna

Ok, so here are my questions:

What is the true name of this antenna is it a DOUBLET or a DIPOLE ? In the ARRL book, it says Dipole = Doublet so I guess they are both the same? Please clarify

Will the antenna have a `hot' side? Ie will it TX from one leg of the antenna and use the other leg as the ground? Or does it TX from the whole of the antenna? Reason I ask is one leg of the antenna is quite surrounded by buildings and the other leg is completely in the clear so if it does matter which polarity the antenna is setup on, I will disconnect it from the balun and swap over the two wires if the hot side is the leg which is surrounded by buildings? I know it should be easy to try but actually in my set up it is quite a task to get to the balun.

This antenna works extremely well on 80mtrs (as it should I guess), on top band 160m it is workable but not great performance and similar on other bands it works, but not great performance. So I am trying to get the best performance out of this antenna across all bands. A local "G3" explained to me that although it is a balanced antenna and therefore theoretically it does not need a ground radial system, by installing a ground radial system (counterpoise) will help with performance on top band 160 metres and also the other bands. I am not convinced this will help, and would require any comments as to your thoughts on this subject.

By installing an extensive counterpoise ground radial system will it help performance with this antenna? I do have an RF ground system simply 6 x 8foot copper rods hit into the ground joined with thick earthing cable connected to the ATU by a short 4 foot length of earthing cable (the shack is in a shed literally above the soil hence short earth cable length). Which leads onto my next question: What length radials should I install? Again I have confusion about this. My garden is 140foot long by about 20 feet wide. The best option to me is to lay lengths of copper wire on the grass and pin to the ground via steel staples. Some sources say earth radials on top of the grass stapled in do not need to be any particular length as the soil constantly changes resistance. If this is the case should I install multiple ground radials of different lengths or just one very long length? Obviously it is easier to do one long length. What length should I do? Some tell me to simply lay the radials the same length as the antenna ie 140 foot or 420 foot if I go by the real length of this antenna ☐ which should I do, and how many? Others tell me I should install the ground radials one quarter of the

length of each band used but others tell me this is only applicable to ground mounted verticals. Others tell me to lay as much wire as possible and others tell me not to bother it wont make any difference.

Looking forward to your comments, and thanks for your help and advice in advance

73, Simon ☐ G7IVJ

Reserve capacity is another way to measure amp-hours. That's the number of minutes you can draw 25 amps before the battery gets down to 10.5 volts (this is theoretically how long you can run your car if the alternator dies)

So 100 * 25 / 60 would be 41 amp-hours. If you run a 25% duty cycle at full power, you can probably expect around 8 hours of operation, assuming the battery is in good shape. Some deep cycles have a bad habit of deteriorating fast if not maintained, however, so it might be a good idea to test it before you try to use it for anything serious.

I think that is telling you that the cold cranking current is 50amps and
100 amps for a short burst

I think if you just run a single long wire counterpoise, it will help.
Take a look at this article by Bill N8SA

I've only heard the term "doublet" a couple of times, but if the ARRL says they're the same, I'm not sure what you need clarified. There are a few other terms here and there that are synonymous, but people still prefer one or the other. (For example, some people say "Cycles", while most of us say "Hertz".)

It looks to me like this antenna is balanced - meaning there's no hot side. The entire antenna pushes out 1/2 of a wavelength. You need both ends of the antenna to be in the clear for things to work properly. Actually, even on an unbalanced antenna, you should have both sides in the clear. It's a fallacy to think that the ground on an unbalanced antenna is less important than the radiator. The ground is still half of your signal, and removing that half makes the antenna non-resonant.

This antenna is interesting, though. It looks like a variation on the G5RV antenna, which uses the ladderline as part of the radiator: when the antenna is running off-resonance, the feedline acts like part of the antenna. This is similar to the way a discone works, if I understand correctly. (not identical, but the same general idea...)

I'm thinking that a radial system can't hurt, if it's grounded to the coax at the feedpoint... Try connecting it to the coax side of your balun.

If performance is an issue, you might also consider a parallel or fan dipole. You basically just build multiple dipole antennas fed off the same balun. My 3-band dipole currently works on 80, 40, 20, and I get 6 for free. (You get odd harmonics for free on a dipole. 6M is the 7'th harmonic of 40M)

This is the exact audio I have with mine...The shriller audio covers up stations I readily receive on my TS2000 with 100% copy...The noise blanker will lower that a bit more on certain bands...I check in on a 10 meter net that in the hills lends itself to zero s-units on several stations and they are drowned out with this noise and I receive them fine with zero s-units with the TS2000... And as a rule I can have 2 s-units more noise on the 897 than my TS2000 at any given time...Thats in rural Montana...

One more thing what are the differences in the specs on the preamp in each radio?

Gary

This is the exact audio I have with mine...The shriller audio covers up stations I readily receive on my TS2000 with 100% copy...The noise blanker will lower that a bit more on certain bands...I check in on a 10 meter net that in the hills lends itself to zero s-units on several stations and they are drowned out with this noise and I receive them fine with zero s-units with the TS2000... And as a rule I can have 2 s-units more noise on the 897 than my TS2000 at any given time...Thats in rural Montana...

But how does the signal to noise ratio actually compare?

S-meter readings are meaningless unless a) the meters are calibrated, and b) the radios have identical gain when they are being compared (pre-amp/rf gain/attenuator settings).

The S-meter on the 897 is anything but calibrated, so using it for any comparison of noise is pointless. It is very non-linear a few dB's can change the display by several S points!! It is probably the 897's worst feature.

26456. RE: [FT897] Help with counterpoise & 80m wire questions and advice please ?

Yahoo group: FT897 (2009)
Date: 2009-06-16 15:59:34 UTC
From: Cliff Bryant
Topic: 26447 Message: 26456

It's also warm down here in Dorset today....

A doublet becomes a dipole at its resonant frequency. IE two pieces of wire cut for 80m that are resonant on 80m are a dipole but if you use a tuner to load them up on say 60m they become a doublet.

By convention a dipole is simply an aerial cut for (ie resonant on) a band. I have a dipole here for 160m and another dipole for 80m and 17m. The three aerials are resonant on their respective bands. I feed them with coax and don't bother with baluns but that's another story.

If you feed the doublet with a balanced tuner or via a balun (not recommended at high mismatch) then both sides will be 'hot'. If you feed the doublet via coax you will lose considerable power in the coax as the mismatch will likely be high. You'll also get currents on the shield which will cause all sorts of trouble.

An aerial such as you describe will not be an efficient radiator on 160m as it is simply too short, yes it will radiate, but no, your signal won't be strong. I reckon that by going from an 80 meter dipole (actually it was longer to avoid high impedance so it's technically a doublet) to a 160m dipole I gained about 20dB - quite significant. 160m is a tricky band, you can often hear 'em but you can't work 'em unless you have an aerial for the job.

The G3 was suggesting a decent earth system because some folk strap the two feeders together and feed the resultant 'Marconi T' against ground. That can actually work very well but it does most definitely need a decent ground. Your earth stakes are a good start but without radials attached to them (you can simply lie them on the ground) they won't do much. Length wise there are many arguments and comments on the web: I personally have found that having say 4 or 5m of dense earth matting immediately around the base of the aerial is essential. I use galvanised matting from B & Q (2cm * 3cm slots) at the base and then a variety of radials in all directions. The key thing here is quantity and reasonable length. If you measure the impedance of the aerial you'll be quite surprised how much it will change as you add radials up until you have say 16 radials attached. You really do need to make a decent job of the earth for an unbalanced aerial.

The good news is that for the inverted V you probably won't get much improvement if you have a ground system if you are running it as a doublet and it's a reasonable job (height, construction etc) so don't fret about an earth other than for safety, RF bypass and general well being reasons unless you are end feeding a wire or the Marconi T as

described above.

One other note about an outdoors earth connected directly to the radio, make sure you don't have a PME system in the house where the neutral is bonded directly to the earth otherwise you could end up carrying you power and possibly the power of a few more houses locally to ground via you earth wire and rig! Ouch!

With aerials whatever you do your mileage will vary based upon locations and conditions.

Hope this helps and have fun.

Subject: [FT897] Help with counterpoise & 80m wire questions and advice please ?

Gentlemen and ladies

Very warmest wishes from London !

Firstly, sorry for being off topic and thanks for the bandwidth! I do own an FT-897D (see my other posts)

My station call is G7IVJ just getting back on HF again after a few years of non-HF

I have a few questions relating to my 10m to 160m wire antenna made by www.k1jek.com it is the 140 foot version, which is made of 420 feet of wire and should work 10m through 160m. It is installed at 38 feet to the centre as an inverted V, and each end drops to about ten feet off the ground. For a better description about the antenna take a look at: http://www.hamuniverse.com/cobraantenna

Ok, so here are my questions:

What is the true name of this antenna is it a DOUBLET or a DIPOLE ? In the ARRL book, it says Dipole = Doublet so I guess they are both the same? Please clarify

Will the antenna have a `hot' side? Ie will it TX from one leg of the antenna and use the other leg as the ground? Or does it TX from the whole of the antenna? Reason I ask is one leg of the antenna is quite surrounded by buildings and the other leg is completely in the clear so if it does matter which polarity the antenna is setup on, I will disconnect it from the balun and swap over the two wires if the hot side is the leg which is surrounded by buildings? I know it should be easy to try but actually in my set up it is quite a task to get to the balun.

This antenna works extremely well on 80mtrs (as it should I guess), on top band 160m it is workable but not great performance and similar on other bands it works, but not great performance. So I am trying to get the best performance out of this antenna across all bands. A local "G3" explained to me that although it is a balanced antenna and therefore theoretically it does not need a ground radial system, by installing a ground radial system (counterpoise) will help with performance on top band 160 metres and also the other bands. I am not convinced this will help, and would require any comments as to your thoughts on this subject.

By installing an extensive counterpoise ground radial system will it help performance with this antenna? I do have an RF ground system simply 6 x 8foot copper rods hit into the ground joined with thick earthing cable connected to the ATU by a short 4 foot length of earthing cable (the shack is in a shed literally above the soil hence short earth cable length). Which leads onto my next question: What length radials should I install? Again I have confusion about this. My garden is 140foot long by about 20 feet wide. The best option to me is to lay lengths of copper wire on the grass and pin to the ground via steel staples. Some sources say earth radials on top of the grass stapled in do not need to be any particular length as the soil constantly changes resistance. If this is the case should I install multiple ground radials of different lengths or just one very long length? Obviously it is easier to do one long length. What length should I do? Some tell me to simply lay the radials the same length as the antenna ie 140 foot or 420 foot if I go by the real length of this antenna - which should I do, and how many? Others tell me I should install the ground radials one quarter of the length of each band used but others tell me this is only applicable to ground mounted verticals. Others tell me to lay as much wire as possible and others tell me not to bother it wont make any difference.

Looking forward to your comments, and thanks for your help and advice in advance

73, Simon - G7IVJ

26457. RE: [FT897] batteries

Yahoo group: FT897 (2009)
Date: 2009-06-16 16:33:30 UTC
From: Ted Wrobel
Topic: 17604 Message: 26457

Hi Ben,

What you have is likely a group 24 size deep cycle battery. Assuming it is not a premium type battery it would likely be rated at about 75 Amp Hours.

You can measure the size and check the web for size charts - sizes are pretty well standardized by group.

This is commonly listed as the 20 hour rate, that is the number of amp hours you could total over a 20 hour discharge.

For 75 amp hours that would mean about 3.5 amps continuous for 20 hours.

Of course radios often run 5% transmit, 95% receive so you need to estimate the average amp draw to find out how long the battery would last.

Thus in an hour you might draw 20 amps for 3 minutes and 1 amp for 57 minutes for a total of 77 amp minutes or about 1.3 amp hours.

At that rate you might get 48 hours runtime before the voltage dropped below 11 volts.

You then get into the question of what voltage your radio will tolerate (send & receive)

Hope this helps a bit.

Evening everyone,

Question. I have a deep cycle marine battery here at the house but I don't know anything about the battery.

here is what it says on the outside of the battery. part# is HD24-DP. Cranking at 32F is 505. Resevere capacity is 100.

based on what I have just said does anyone know what amps this battery is?

73,

Ben

Your battery is a product of Interstate Batteries. It is a Group 24 Marine/RV starting battery, not a deep discharge battery. It has 405 Cold Cranking Amps capacity (30 sec at 32F), It will deliver 5 amps for 16.4 hours, 15 amps for 4.6 hours, and 25 amps for 1.7 hours. Assuming a 10% transmit duty cycle and transmitting at 100 watts, that would mean you could operate for about a day before having to recharge it. It sells online for about $80 plus shipping. It weighs about 40 pounds. This battery appears to be designed as a "compromise" between high cranking capacity and deep discharge.

Interstate's single-purpose deep cycle batteries (serial numbers start with U) are bigger and heavier, and have a LOT more capacity. The smallest of them, which weigh about 50% more than your battery, have almost 5 times the reserve capacity as your battery -- specifically, 474 minutes reserve capacity at 25 amps, vs 100 minutes. Your battery should be a decent battery for off-grid use, but if I were buying new, a battery designed specifically for deep cycle would be preferable. There's a trade-off in design configuration in lead-acid batteries; you can have a very high current output (which you need for cranking a cold car or boat engine), but batteries optimized for high amp output have lower overall capacity, and don't like to be fully discharged. A deep discharge battery has a lower max amperage output but much greater total amp-hour capacity, and it doesn't mind being deeply discharged. These characteristics are preferable for powering portable radios. The smallest of the deep-discharge batteries would carry you for five to 7 days on a single charge.

I found this info by googling on your part number, and landed at:

http://www.go2marine.com/product.do?no=70901F

On that page, if you click on the link "Complete Interstate Batteries Comparison with details" it will give you a PDF with extensive comparative details of all Interstate batteries.

Subject: Re: [FT897] batteries-12 volt, 6 cell, lead-acid vs FT-897

NO, those figures do not mean 50 amps cranking and 100 amps for a short time! The figures mean that the battery will produce 505 amperes to start an engine, at a battery temperature as cold as 32 degrees F. (When so operating, the battery terminal voltage will be LESS than 12 volts) It also means that the battery can operate a specified load for at least 100 minutes before becoming excessively discharged. (This load is usually about 25 amperes) Translated into terms usable with the FT-897, this means the battery is likely to have at least 75 ampere-hours capacity at a 20 hour discharge rate, or that it can operate a device drawing 3.75 amperes for 20 hours, with a voltage of 10.8 volts or higher. (You could possibly operate the FT-897 for 8 hours of intermittant CW/SSB at 100 watts transmit, if transmit was 30% or less, before voltage dropped to
12.0 volts. The battery cannot be used for its full capacity, as its voltage is too low during a significant portion of its discharge cycle to provide proper transmit performance of the FT-897) This radio performs as intended with voltages of 12.5 to 16.0 volts, and operating below 12.5 volts is likely to result in transmit distortion and frequency instability. Receive performance is not as affected by low supply voltage. Usable capacity is thus only about 60% of what would otherwise be available from a typical 12 volt, 6 cell, lead-acid battery, because the radio does not normally operate properly between 10.8 volts and 12.0 volts! (Devices must be capable of proper operation at 10.8 volts to utilize 100% of the charge in a typical 6 cell, 12 volt lead-acid battery.)--73, KC3VO, Bob Curry

> "intended to be used."

I think some folks may be misinterpreting my remarks, and possibly the remarks of others. I think most, if not all, of us here are 897 owners. And I think that most, if not all, of us like our 897s. So I don't think any of us are trying to disparage the 897. But lets step back for a second. When an engineer sets out to design a radio, they need to make decisions along the way which sculpt the way the radio turns out. Some of these relate to the quality of the product, and some of them relate to it's intended use. When someone sets out to design a "portable" radio, they must make some compromises that may make the product less desirable in other applications. One example is the number of buttons (fewer dedicated buttons to specific functions, more multi-function buttons). This is not to say that a radio can't be used other than how it was intended, or how it was mainly envisioned. Some radios come out well and function far beyond their intended area, the 897 may well be one of those radios.

As for the subject analysis (noise floors, etc)... this can depend a lot on the environment to which your 897 is subjected. This is why I quoted numbers from the ARRL labs. It provides a more objective view of the capabilities. Of course your mileage may vary because you may live in an area where you need more intermod reject, or some other feature that is not necessarily measured, reported, or even known to be needed.

It is not actually that difficult to get into split mode without realizing it if you were punching buttons to see what difference they made.

Probably however you may have activated the "Clairfier" control which does the same thing as running split but in an easier format. It has a small limited freq that it can slide from the main frequency (+-9.99KHz). The easy way to tell if one of these is on is to look at the upper left of the display - if there is either a + or - you have the clarifier on, spl means you have the split mode on. To turn clarified off/on toggle the button just above center and between the two lower right dials.

see manual pages 23 and 38 for details on these modes.

26463. Collins Filters

Yahoo group: FT897 (2009)
Date: 2009-06-16 19:38:45 UTC
From: Thomas Wilson
Topic: 26463 Message: 26463

I have a question about the Collins filters that can be installed in the FT-897. I'd prefer to hear from someone who has actually installed and used them.

Are these IF filters or audio filters? It's an important distinction because of how the receiver reacts to strong nearby signals.

Here's my situation: there are several operators in my area who also operate PSK, and most of the PSK on 20 meters lately has been within a range of maybe 1-2 Khz. There can often be 10 or more QSO's going on in a 2K range - some just barely readable, and some so close that I could drive to the operator's house in less time than it takes to exchange signal reports and rig information.

The problem is that when a strong signal comes in, it completely blanks the weaker signals, since the receiver's AGC has to cut down the input. So when a guy in the next town is transmitting, I can't hear a guy in the next state (or country.. I get a lot of Canadian and some Mexican traffic, and I've talked to Hawaii and the islands in and around Australia.)

So my question is this: If I get the 300 Hz Collins filter, will this reduce the strong neighboring signals, allowing the gain control to come back up, or is it just an audio filter, which will keep the AGC depressed, not letting me hear distant stations at all when someone 10 miles away is transmitting at 100 watts?

Tom,

Thay are IF Filters. An audio filter would be massive. It wouldn't fit in the radio. I use both SSB and CW Collins filters. They are the standard for IF filters. They have been around since i was in kid in the 60's.
Now, the radio also has DSP. However, the DSP is audio DSP, not IF DSP. So, with nearby signals that are EXTEMELY strong, you will get AGC Pumping. It is unavoidable, espeically in contests where everyone is right next to each other.

And a roofing filter would help some, but roofing filters are not available for the 897. Only on very expensive radios. So, if you want a Yaesu radio, and you want IF DSP and you want a roofing filter, you should be buying an FT-1000, FT-2000, FT-950 or FT-9000

The radio is a great radio, just not a serious contesters radio, in my opinion.
I do not know if you can use the 300 Hz filter in digital mode. I never tried it because I use the mic input and speaker output for my digital modes. These connections do not go through the data port on the back of the radio. Maybe someone else here has this experience. But you will definitely see the signal of interest drop on a spectrogram from a strong nearby signal without any filtering.

Thanks, Dan. That helps. But I'm still not clear on something: will adding the 500Hz or 300Hz filter reduce AGC pumping, or do I pretty much have to graduate to a better radio to get around that problem?

Also, can the IF shift help with AGC pumping, or does the AGC do its magic before the signal hits the IF shift?

Hi Tom -

I have the CW filter and SSB filters in my 897, both Collins. The 897 already has an audio filter - the DSP in the audio chain (works darned well when not subject to overload!)

It seems you have strong signal overload of the front end. Local stations on nearby frequencies will wreak havoc on any receiver but the very best (those that have very, very narrow front ends, some of the older radios with preselectors are fair at it!) The narrow filters will not help with really strong signals, that problem (causing AGC pumping) is up the chain.

If you are indeed dealing with locals on nearby frequencies, your best bet is to get "away" in frequency as much as you can (the roofing filter bandpass is, what, 15 kHz?), get an antenna with a null in their direction to reduce the signal strength of the offending signal, maybe even get a very, very high Q antenna tuner that attenuates the signals off to the side of your center frequency. I use an old Harvey-Wells Z match that, with my antenna, provides very high Q and attenuates signals outside a narrow bandpass. I'm not sure it helps much within 50 kHz or so, though.

Very good luck with it.

Well put Chip.
My 897 has its limitations and I use my Drake R4-C or FT1K for base work and my 897 for digital work.
The 897 has a little more noise than my other rigs although it does work quite well.
You covered it well with your post.

I use the 500Hz one and it works reasonably well. A strong signal right next to the one I'm listening to will still give trouble, but it does narrow the band quite well. I've used it to take out some of the stronger signals on the band and select the one I'm after.

It is an IF stage filter. Mechanical not digital so can't be as sharp but quite sharp (the 300 will do better). You can shift its pass band around too which is nice.

There's an additional audio stage DSP which can maybe help make things cleaner for your computer. You can take control of the RF gain, but of course risking distortion if you turn it up in the presence of strong signals. I've not tried this.

I think a lot depends on situation. I've taken my 897 into a field away from common electrical noise sources, run it off a battery, and had beautiful clear reception even of weak signals. I've heard everyone in a net where people in the net had trouble hearing each other.

At home I've had more difficulty at times I think because of more electrical noise from nearby houses and antenna not so in the clear, but it has worked well. I suspect there are situations where a more expensive bigger radio may have performed better or helped me make or keep the contact, but the 897 does do a good job.

One day I may buy a bigger home station. I'd also consider the 817 as a portable rig due to its reduced size and that the battery pack is included in the cost. You can do a fair amount at 5W if you get your antenna working. The 897 is quite big for just putting in a backpack but if your intention for the outing is radio then it's not a hard job to carry it up whatever mountain you're climbing. In that respect it gives you a good portable rig.

The menus can slow down operation, but then you just take things more slowly. I sometimes have trouble remembering where things are that I don't use often.

Morning Randy & Group,

I have decided to buy a used FT-897D from another ham here in MN. Randy since we are talking about radios in the shack.. I justrectly picked up a used 570D from a ham in West Fargo here rectently and I hear him use on the air before hand and he sounded good with it so...so I bought it.

In the mean time tim to go back to racking my brain on my go kit!

73,

Ben

Ben,

The K3 is a totally different animal. It can have dual receivers, roofing filters, DSP at the IF level, lots of features not available in less expensive radios. There is even a panadapter available for the K3. I own an FT-857 and a FT897. I wanted a high quality DX radio so I looked at the K3 after hearing them on the air and reading the rave reviews. Some serious DXers are giving up their FT-1000 radios for the K3.

The basic K3 starts at $1849.00 in kit form. By the time you add an internal antenna tuner and other accessories you are in the $2600.00 price range. I decided to sell my TS-2000 (Kenwood), keep the FT-857 for mobile use, the FT-897 for portable use and buy a FT-950 for my shack. So far it has been a fantastic radio, and seems to hear much better than the TS-2000 did. I could have purchased two FT-950 radios for the price of one K3. So, yes I did put a price limit on how much I was willing to spend for a radio. As the saying goes, different strokes for different folks, they even make $10,000.00 radios if you want to spend that much.

If you are considering the K3 take the time to read the reviews on eham.net. The FT-857 and FT-897 are great radios, but I do not feel they are in the same class as the K3.

So let me ask this then group,

    If I got an 100Mah Battery would that be enough? Please bare in mind this not just designed to power the 897 but other radios & a TNC I can recap the equipment I am going to be using if anyone likes? the issue is how do i charge it? My other question is even though the battery is charging can it still handle a load on it?

I found this battery on this would this work?

Subject: Re: [FT897] batteries

Your battery is a product of Interstate Batteries. It is a Group 24 Marine/RV starting battery, not a deep discharge battery. It has 405 Cold Cranking Amps capacity (30 sec at 32F), It will deliver 5 amps for 16.4 hours, 15 amps for 4.6 hours, and 25 amps for 1.7 hours. Assuming a 10% transmit duty cycle and transmitting at 100 watts, that would mean you could operate for about a day before having to recharge it. It sells online for about $80 plus shipping. It weighs about 40 pounds. This battery appears to be designed as a "compromise" between high cranking capacity and deep discharge.

Interstate's single-purpose deep cycle batteries (serial numbers start with U) are bigger and heavier, and have a LOT more capacity. The smallest of them, which weigh about 50% more than your battery, have almost 5 times the reserve capacity as your battery -- specifically, 474 minutes reserve capacity at 25 amps, vs 100 minutes. Your battery should be a decent battery for off-grid use, but if I were buying new, a battery designed specifically for deep cycle would be preferable. There's a trade-off in design configuration in lead-acid batteries; you can have a very high current output (which you need for cranking a cold car or boat engine), but batteries optimized for high amp output have lower overall capacity, and don't like to be fully discharged. A deep discharge battery has a lower max amperage output but much greater total amp-hour capacity, and it doesn't mind being deeply discharged. These characteristics are preferable for powering portable radios. The smallest of the deep-discharge batteries would carry you for five to 7 days on a single charge.

I found this info by googling on your part number, and landed at:

http://www.go2marin e.com/product. do?no=70901F

On that page, if you click on the link "Complete Interstate Batteries Comparison with details" it will give you a PDF with extensive comparative details of all Interstate batteries.

NO, those figures do not mean 50 amps cranking and 100 amps for a short time! The figures mean that the battery will produce 505 amperes to start an engine, at a battery temperature as cold as 32 degrees F. (When so operating, the battery terminal voltage will be LESS than 12 volts) It also means that the battery can operate a specified load for at least 100 minutes before becoming excessively discharged. (This load is usually about 25 amperes) Translated into terms usable with the FT-897, this means the battery is likely to have at least 75 ampere-hours capacity at a 20 hour discharge rate, or that it can operate a device drawing 3.75 amperes for 20 hours, with a voltage of 10.8 volts or higher. (You could possibly operate the FT-897 for 8 hours of intermittant CW/SSB at 100 watts transmit, if transmit was 30% or less, before voltage dropped to
12.0 volts. The battery cannot be used for its full capacity, as its voltage is too low during a significant portion of its discharge cycle to provide proper transmit performance of the FT-897) This radio performs as intended with voltages of 12.5 to 16.0 volts, and operating below 12.5 volts is likely to result in transmit distortion and frequency instability. Receive performance is not as affected by low supply voltage. Usable capacity is thus only about 60% of what would otherwise be available from a typical 12 volt, 6 cell, lead-acid battery, because the radio does not normally operate properly between 10.8 volts and 12.0 volts! (Devices must be capable of proper operation at 10.8 volts to utilize 100% of the charge in a typical 6 cell, 12 volt lead-acid battery.)--73, KC3VO, Bob Curry

Assuming worst case, which is transmitting at 100 watts output, and assuming that you could drain the battery to 90% before its output voltage drops to the point that the transmitter will go on strike, you could transmit continuously using this battery for approximately 4 hours.

If you make more realistic assumptions, such as 50 watt transmit power and 10% transmit duty cycle, and using squelch to reduce current drain when in receive mode, you're looking at much better numbers: current drain in squelch mode is 0.6 amp; in receive mode is 1 amp; in transmit mode will be about 12.5 amps. Let's assume that in receive you're in squelch mode half the time, so your average current draw when not transmitting is 0.8 amp. If you are in receive only mode, you could operate for 90 ÷ 0.8 = 112.5 hours.

Every minute you transmit at 50 watts draws 15 times as much current as when receiving. (If you transmit SSB, the current draw will be 1/2 to 1/3 what you would use on FM or AM).

If you transmit for one hour at 50 watts FM, you consume 12.5 amperes, and thus 12.5 ampere hours, That leaves 99-12.5) ÷ 0.8 = 96.875 hours receive time.

So, to generalize as a rule of thumb, your 100 ampere hour candidate battery would allow you to operate for about 100 hours. You can scale that up or down; assume about 1 ampere hour battery capacity will give you about 1 hour of operating time at 50 watts and using squelch. You can extend the time somewhat by lowering transmit power, and by operating in SSB mode, and if you turn off squelch, which you would most likely do on HF bands using SSB, you would draw more current in receive mode.

This battery should serve you well for off-grid applications. For its amp-hour capacity, it's relatively small and light; the AGM construction means you can tip it over without spilling battery acid. It should recharge quickly. There are other deep-cycle AGM batteries on the market that I would also consider if I were buying a battery right now. For one, the Optima Yellow Top D31, which has about 75 ampere hour capacity but costs less. The Optima batteries are sold by Interstate Battery dealers, and also at Sears, and at many stores that cater to off-roaders, who are fanatic fans of Yellow Top batteries for winches. If size, weight and cost are not issues, you might want to look at the Odyssey PC1800-FT, which weighs 130 pounds but packs 214 amp hours. Also AGM spiral wound, like the Optima. It has an unusual form factor -- 22 x 12 x 5 inches -- which might be desirable and might not, depending on your intended use. See http://www.odysseybattery.com/

That looks like a good battery.

Charging: you should use an automatic charger, they shut down the charging current when the battery's full. And yes, while you can run the radio off the battery while it's charging, but it's smarter to have a real power supply for base ops. A big reason is the possibility of hydrogen venting: batteries can vent hydrogen gas while charging, and hydrogen is very explosive.

The answer of whether it's "enough" is pretty simple. You just need some simple math: find out how much current you're going to draw over a 1 hour period, and then divide the battery's capacity by this number.

You mentioned a TNC, so assume I'm going to run PSK. PSK is a rather high-duty mode, but I'm going to run at 40 watts. So assume I'll draw 10 amps while transmitting, and I'll transmit maybe 1/4 of the time. That means I draw 2.5 amps in 1 hour while transmitting, and maybe 1 amp while listening during that hour. That's 3.5 aH for my radio.

The TNC might draw 500mA (I have no idea, to tell you the truth, so I'm guessing.)

So 3.5+.5=4 amps

We can't use the entire capacity of that battery, since the radio is not going to transmit well when we get below 12 volts. So let's say we can use 75 Ah. 75 Ah at a 4A rate will run your radio for about 18 hours.

Subject: Re: [FT897] batteries

Assuming worst case, which is transmitting at 100 watts output, and assuming that you could drain the battery to 90% before its output voltage drops to the point that the transmitter will go on strike, you could transmit continuously using this battery for approximately 4 hours.

If you make more realistic assumptions, such as 50 watt transmit power and 10% transmit duty cycle, and using squelch to reduce current drain when in receive mode, you're looking at much better numbers: current drain in squelch mode is 0.6 amp; in receive mode is 1 amp; in transmit mode will be about 12.5 amps. Let's assume that in receive you're in squelch mode half the time, so your average current draw when not transmitting is 0.8 amp. If you are in receive only mode, you could operate for 90 ? 0.8 = 112.5 hours.

Every minute you transmit at 50 watts draws 15 times as much current as when receiving. (If you transmit SSB, the current draw will be 1/2 to 1/3 what you would use on FM or AM).

If you transmit for one hour at 50 watts FM, you consume 12.5 amperes, and thus 12.5 ampere hours, That leaves 99-12.5) ? 0.8 = 96.875 hours receive time.

So, to generalize as a rule of thumb, your 100 ampere hour candidate battery would allow you to operate for about 100 hours. You can scale that up or down; assume about 1 ampere hour battery capacity will give you about 1 hour of operating time at 50 watts and using squelch. You can extend the time somewhat by lowering transmit power, and by operating in SSB mode, and if you turn off squelch, which you would most likely do on HF bands using SSB, you would draw more current in receive mode.

This battery should serve you well for off-grid applications. For its amp-hour capacity, it's relatively small and light; the AGM construction means you can tip it over without spilling battery acid. It should recharge quickly. There are other deep-cycle AGM batteries on the market that I would also consider if I were buying a battery

right now. For one, the Optima Yellow Top D31, which has about 75
ampere hour capacity but costs less. The Optima batteries are sold by
Interstate Battery dealers, and also at Sears, and at many stores that
cater to off-roaders, who are fanatic fans of Yellow Top batteries for
winches. If size, weight and cost are not issues, you might want to
look at the Odyssey PC1800-FT, which weighs 130 pounds but packs 214
amp hours. Also AGM spiral wound, like the Optima. It has an unusual
form factor -- 22 x 12 x 5 inches -- which might be desirable and
might not, depending on your intended use. See http://www.odysseybattery.com/
.

Thomas and All:

That's true as long as you're running near the standard "20 Hour" rate, that you are willing to discharge the battery that far for each cycle, and that the radio is happy with the near full discharge voltage under load. In reality you're not going to see anywhere near the approximation you make unless you are significantly under-loading the battery.

One related note is that the quiescent state (resting without current) for a battery at 25% discharge is about 12V. When you load it, you're going to have something less than that. So if your radio needs some 12 Volts to operate well, you're either only going to be using 50% capacity or using a battery booster. If you use a battery booster, it will consume more current as the battery charge decreases, which will also decrease your usable time.

Note that batteries are often rated at their "20 Hour" rate. A 100 AH battery should therefore test to 100 AH at a discharge rate of 5 Amps. If you draw more, the total AH available will be less. If you draw less, the total AH available will be more. So, if you're using an FT-897 at 50 Watts and drawing some 12-13 Amps (simply a guess, probably more) then you may see the overall AH rate only if you also do some considerable receiving in between.

So, all this stuff affects your total usable time. How much you want to beat up your battery (it's not a good idea to regularly do a 100% discharge on some batteries), how much current you'll be drawing, what your TX/RX duty cycle is, whether you're using a booster, and even what temperature it is will all make a difference.

I think in the end when you look at lugging batteries around and how much use you might get out of them, QRP starts to be very attractive! Weight for weight, I think you're farther ahead lugging antenna stuff with lower power than battery stuff with higher power. This is also why many military manpacks are 20W maximum.

Maybe the best case scenerio is that I just need to have one battery for each radio. Say 55-75 MAH SLA. Granted that might mean I would need to 3 or 4. but thats ok... it would take alot of guess ork out everything. So I should be able to run for at least two days with a FT-7800R and a TNC running either APRS or Packet. Another one for Voice on VHF and UHF.

thoughts on this ideas?

Do you have a specific scenario in mind? Camping? Off-grid operations? Power during blackouts? Where is this going to be installed? You really want to tailor your setup to your situation. Also, have you considered field charging systems, such as solar? A generator?

A small (1KW) generator may be a better choice for some types of operations than 200 lbs worth of deep cycle batteries, but it's also not a "one size fits all" solution... However, it might be the least expensive if you only need to run off-grid once in a while. I spend most of my camping time in the desert, surrounded by guys with motorcycles and RV's, so I have a 200Ah RV battery and a generator... I can use the generator during the day when things are noisy anyway, and I can run off of battery at night.

It certainly doesn't hurt to have more than one battery, for lots of reasons, but the biggest reason to do that is reliability. Having a second battery on hand means that even if your main battery fails, you have something to fall back on.

As to the specific batteries to buy... I personally prefer to have the biggest ones that my space, size, and budget restraints can handle. The one thing you'll never wish for is that you had *less* power available. :)

You might wish your power source wasn't so BIG, but that's a different issue... having a couple of different size units on hand for different types of ops isn't a bad idea, either.

Hi Tom,

The senerio would be where I am at a say for example a rest stop out side and there is no power at all. As far as mounting these radios I have thought about those TRC's from tac com. For chargning well thats the other issue. i would have to find a way to charge it or just just run a small generator. I do for see not all the time running off the grid, but I want to be ready in case that situation comes up where I have no choice but to run with out the grid.

does that make sense at all? is there such a thing as a cheap generator?

With generators, you can get: inexpensive, powerful, and quiet... pick any 2.

The least expensive generator by far would have to be the Champion generators, sold by some auto parts stores. I bought a 3500 watt unit from Kragen Auto Parts for about $350 just before Easter of last year (2008). They also sell a 1500 watt model for (I think) around $150.

The best *small* generator by far would be the small Honda inverter generators. They are actually DC generators that feed a 120v inverter. They're quiet, too, so you can get away with running them in places where you couldn't run a bigger, noisier one. The down side is the price... they start at around $780 for a 1000 watt model. A quick Google search for "Inverter Generator" shows many different models by different manufacturers at practically every price imaginable.

A couple of years ago, I actually picked up a small Chinese 2-stroke generator for about $90. One advantage of a 2-stroke is that they don't require crankcase oil, and they're dead simple to operate... as long as you remember to mix the oil and gas and keep spare spark plugs on hand.

When you look at generators, you want to consider the sound level and the power output. Remember that the sound level is maeasured at some distance, such as 70dB from 10 feet. But also remember that the distance dramatically affects the sound level, so use a calculator like this to adjust to some reference distance:
http://www.mcsquared.com/dbframe.htm

26484. RE: [FT897] batteries

Yahoo group: FT897 (2009)
Date: 2009-06-17 20:33:08 UTC
From: D. F.
Topic: 17604 Message: 26484

Remember too, the 897 will only provide 20w when using the internal batteries on ANY band (supposing that is what the discussion is about - I haven't seen the entire thread).

However, supposing you are going to be off-grid due to a local power outage of some sort (usually B/C of a storm or some drunk took down the pole), you should figure at least a good 5 to 8 hours worth of operation on a back-up battery system. If there is a "widespread" outage, then you need to figure a good 24 to 48 hours MINIMUM! The type of battery makes a difference too. I use a gel-cell I was given from a friends electric wheelchair. I keep it on a float charger and it has always been there when I needed it (3 times to date in the last 4 years).

If you are planning an outing of some sort, try to plan to use the lowest power possible. If you are going to be on a hill, or at least somewhere with elevation, you will NOT need full power on UHF/VHF. Same applies to HF, but it depends on what you are trying to accomplish. If you are only talking domestic qso's, 10 to 20w should do you with no problems. If DXing, you might want more power just to be heard above the noise floor on the DX side (and DX means OUTSIDE the continental United States/Canada/Mexico).

So, that is what you need to consider when you are going to use batteries. As was stated, the more power you put into your signal will draw more amperage from the battery. Lower power will get more time on the battery, more power will get less time. Oh, and don't always believe what the manufacturer puts on the battery. In many cases it never is correct. Always give it a good test and make your calculations from that, that is the only way to get an accurate idea of how long you can run on that battery.

Not really. But like I said, when you get the battery, hook it up and run your equipment and keep track of the time it takes before the power starts falling off where it is not providing proper power anymore. That is going to tell you how long you have. The figures and the math really are only approximations based on the engineering of the battery. Each battery is different since each has its own flaws and quirks that engineers really can't foresee.

The only way to know for sure is to test it out when you get it. The best way to keep it charged, IMO, is to use a float charger. I got mine at Harbour Freight and it works very well.

Good luck!

Steve,

I have not seem spikes to 100 Watts when output power is set to 5 Watts, but even 30 Watts spikes may cause damage.

If I find the time in the coming weeks I will investigate the behavior with ALC bias applied to the ACC jack. but I can't promise anything as I am quite busy at the moment (And I also cannot find a mini DIN plug in my junkbox, although I was sure I had one..)

Kind regards,

Minto Witteveen pa3bca

Subject: [FT897] Re: QRO Spikes at QRP

Hi Minto,

Thank you very much for your investigation. You have confirmed my fears, the FT-897D can only run at reduced power after a 100W spike.

I wonder if a fix maybe to apply an external bias voltage on the ACC Jack to use as a fixed ALC voltage? This could be a 9V battery with a potentiometer. This way the output should be reduced from the start. It might even be easier then going through all the menus. In fact, an external box with a momentary DPDT switch, 9V battery, pot., and a three-wire cable could send the rig a "TX request" and an ALC voltage for reduced power all at the same time to make a nifty "tune" button for automatic antenna tuners (ref. ACC Jack, pg. 18 of manual).

Please don't muck about with external battaries - you're endangering
your CPU if the plug isn't in in full when you hit the tune button.

There's another way to trigger the processor in battary mode,
automagically reducing power to 20 watts, but only during tuning -
see the files section of this group for the way I did it.
Just requires one diode, one resistor, and no external kit.
Works beautifully with the AT897, too.

Topic: 26488 Message: 26488

Just purchased an LDG YT-100 for my FT-897D. It came in the mail yesterday and I got a chance to put it through it's paces today. I connected it to a Buddipole in a 20m Vertical configuration. The counterpoise fell to the ground during the initial tuning, which made it hard for it to tune. But after I noticed and propped the counterpoise back up it tuned great. I was able to get a very low SWR (barely registered on the 897 meter) throughout the band. I didn't make any contacts, but it was raining, windy, and I only had a little time before I had to pack up and get ready for a club meeting. Speaking of which I need to shoot this off and go ...

From: Randy Charles Ford
Topic: 26490 Message: 26490

There's a recall of BattEQ Battery Equalizers manufactured by SmartSpark Energy Systems Inc., of Champaign, Ill. The recalled equalizers can overheat, posing a fire and burn hazard. The U.S. Consumer Product Safety Commission's web page on this is at http://www.cpsc.gov/cpscpub/prerel/prhtml09/09249.html

The product has been discontinued by the manufacture and a refund is available.

Best thing to do with mailing list spam is NOT reply to it. That will just add to everyone's inbox load. The list admin will take action without our help. :)

(And yes, I'm aware of the irony inherent in posting a reply that asks people NOT to post replies...)

Hi Minto,

I already did it. I applied a negative voltage to the ALC pin of the radio and I can adjust the power output down to milliwatts. The specification for the ALC voltage is 0 to -4.5 Volts so I threw together a quick voltage divider with an external battery just to test it out. I think that the high power spike is now gone but I haven't tested it throughly yet to make sure all modes behave properly. Grounded the tx pin causes the transmitter to transmit a carrier no matter what mode you are in so it would be great for automatic antenna tuners.

When I get some time maybe I'll fabricate a small box with a 9V battery and I'll usr a pot for power adjust and a momentary switch for tuning. And of course a fixed resistor to keep the ALC voltage between 0 and probably about -5V.

Oh yeah, you don't need a DIN plug. All you need is a 1/8" stereo plug. It will have ground, ALC voltage, and a TX line that keys the rig when grounded. Pretty cool!

Thanks,
Steve - AA5TB

Sorry Jan, I done did it!

It worked fine and the ACC jack (miniture stereo type) is made for this sort of thing. (Ref. pg. 10, first few paragraphs of manual). And yes, one must be careful not to let the smoke out :-)

Thanks but I could not find your plans but I think I remember reading about them.

Hi Bob, kc3vo,

I'm interested in learning more about batteries, and am currently setting up to also run from a deep cycle marine battery. One thing that surprises me is that you don't see much mention of using a voltage regulator. There are products out there that shut the battery off if the voltage goes outside the range 11.5 to 15v in order to protect your equipment.

Without a voltage regulator, I'm concerned that my other equipment (ie tnc) will experience voltage swings during transmit.

Is it common to use a voltage regulator when operating a ham station using batteries? Do you recommend it?

Thanks,

Ron, KD0HNE

From: Aristotle Zoulas
Topic: 26362 Message: 26507

I am running the iogear usb to serial adapter and for some reason, I can only get HRD to see the radio at 4800 baud. I definitely think it would work better at the faster speed but for some reason I cannot do it. Perhaps with an old computer and a real serial port. Or I can possibly ad a Lava serial card to my machine. I never thought I would have to go back and use serial again--(

Aristotle Zoulas, KC2GBS, Warwick NY

BTW, great info, more than I got on the HRD group.

I've not had this problem with mine. I am running my radio at 38.4Kbps between the rig and PC though. The default is 4.8Kbps. You may want to up the speed of communications between the rig and PC so that there's not so much waiting as commands are exchanged. You'll also notice that HRD responds extremely quickly when you are running nearly 9x faster than standard

To: FT897@yahoogroups. com
Subject: [FT897] Anyone use this radio with HRD

Hello, I am having a problem where when I move the slider on Ham Radio Deluxe, there is a momentary mute of the sound (about 1/100 of one second). Its enough to be a problem as I cannot continuously change the frequency to tune in a station. Works fine from the radio. I posted a similar question on the HRD group and a few people said it was a common problem with the FT-857/897. Some people said they had to sell their radio because of this problem as they liked the program so much.
Any Help, thanks

Aristotle Zoulas, Warwick, NY.

Ben,

for my "Go" kit I have at FT-897 with the LDG AT-897 tuner and the Buddipole Deluxe antenna. This has worked very well. I did have to add the Buddipole switchable balun to help match the radio to the antenna a little better. You will enjoy the FT-897D very much. They are very good at the digital modes like PSK-31, etc.

Have fun

I just noticed that LDG has a new tuner for the FT-897 and FT-857 <YT-100>. Has anyone done a comparison. I am not sure about the advantages of the YT-100 over the AT-897.

Any thoughts off of the specs or by someone who has used both tuners?

Thanks in Advance,

Howard K6SID

26510. A strange 897 fault!

Yahoo group: FT897 (2009)

From: pjm
Topic: 26510 Message: 26510

Hi folks,

I've had a strange fault in my 897 suddenly appear. Whilst transmitting on 2m, 5w into a well matched load, the power consumption of the radio shot up to 15A !! Nothing smelt bad or got hot, anyway I dekeyed and started to look into the problem. With the bottom of the rig off, and the PA shield removed, the current consumption is nominal, the RF output ok to 50 watts, and the spectrum looks as clean as it ever did. However, re-fitting the PA cover results in the current once again increasing to 15A. The culprit is a short earthing tab which is mounted next to one of the ground pins on the 2m/70cm PA transistor, when this touches the underside of the PA cover, the current goes up!

What I don't understand is why this should suddenly have happened, and if anyone else has seen this fault. The PA transistor ground tab measures <1ohm to groups, so is actually ground - there should not be any current flow at all. I don't think it is feedback in the PA as the RF output remains at 5 watts even when its drawing 15A. I initially suspected the PA transistor but RF output is consistent with the set value, so I don't think it is this.

I'm at a complete loss as to what to try next. My quick fix is a piece of kapton tape on the underside of the PA cover to prevent this grounding tab touching it.

If anyone has any suggestions of how to fix this, I'd be interested to hear them.

thanks and regards

Paul M0EYT.

From: Erwin Witt
Topic: 26513 Message: 26513

Hello all,
I'm new to the group and I'm thinking to buy a FT-897D for my portable QTH.

As I mainly operate on 2m I'm very interested in how's the RIG on 2m receiving attributes ?
Also did anybody try 2m EME with that RIG ?

I didn't found that in manual: is it possible to adjust the Pout from outside continuously ?

best regards

Erwin/DK5EW

From: Thomas Wilson
Topic: 26509 Message: 26515

Personally, I don't like the "one button" approach. I prefer a tuner with meters and that let you have a little more control over what's going on.

As to the effectiveness of the tuner: I have the LDG Z-11 pro, and it works pretty well, but it doesn't have the balun for long wires, which you can get with a better tuner. I'm running a resonant antenna on the 3 bands of interest, and I use the tuner to "touch up" the signal when I'm at the extreme of the band (for example, I need help tuning the digital section of 80M, since I have the antenna tuned for 3.9Mhz.)

What I can't do with the Z11 is tune a half-wave dipole as a quarter wave; for example, I can't tune my 80M dipole down to 160M. It was actually possible for me to do this when I was running the off-center fed antenna, but that antenna presented other problems.

Topic: 26460 Message: 26518

Ron,

Shouldn't be any reason for the BATTERY voltage to exceed the limit - just not possible.

However, if your charger were to put out excessive voltage it could damage the rig. It would also likely fry the battery if left high for very long.

So the control issue if the charger circuit. The charger should limit voltages to what is appropriate to the battery.

There should be no upward swing on transmit but there is likely to be a voltage drop unless you use very large, short power leads.

There are some issues with charging a bettery from a typical ham power supply that involve damage to the supply when power fails but the battery reamins connected.

One simple solution is to use a computer UPS unit to charge the battery - float voltage will be OK for many marine batteries.

Subject: Fwd: Re: [FT897] batteries-12 volt, 6 cell, lead-acid vs FT-897

Hi Bob, kc3vo,

I'm interested in learning more about batteries, and am currently setting up to also run from a deep cycle marine battery. One thing that surprises me is that you don't see much mention of using a voltage regulator. There are products out there that shut the battery off if the voltage goes outside the range 11.5 to 15v in order to protect your equipment.

Without a voltage regulator, I'm concerned that my other equipment (ie tnc) will experience voltage swings during transmit.

Is it common to use a voltage regulator when operating a ham station using batteries? Do you recommend it?

Thanks,

Ron, KD0HNE

I have been using a champion 12 volt small tractor battery and a Sears 2/6 amp charger for 5 years now with no problem what so ever with my 897D. Many times the voltage readout goes to 16 volts no problems yet. I am using the original length 12 volt harness and fuses that came with the radio. However the charger cannot keep up with the 22 amps required with 100 watt output so I keep tx's short.

26520. higher power in transwertor mode

Yahoo group: FT897 (2009)
Date: 2009-06-22 19:55:57 UTC
From: Jirka MWW
Topic: 26520 Message: 26520

Dear members,

do you have any idea, how to increase the power in transvertor mode ? We use FT897 on 2meters with 23cm transvertor,
which is installed on high tower and connected with very long cable with high losses. When we switch to transvertor mode
(function 091) , the output power is fixed to 5W only. We would like to get more, but no idea how to do it. There is nothing in the manual about that.
Even this fact (only 5W output) is not documented.
In normal 2 m operation mode it works fine (with about 11W out) , but we loose the chance to set up the real frequency
via 089 or 090 functions. I was looking also into hidden menu, but frankly saying, I do not understand all there.

Any idea , how to solve it ?

Or just think about it for a few seconds.
The lowest frequency you can TX on with the 897 is 1.8 Mc. (factory settings).
135.x is WAY lower so it is extremely unlikely that the 897 would be able to tx on this frequency
Even if you were able to somehow fiddle with the CPU to get it to tx there, the filters are most certainly not designed to tx with any efficiency on 135-137

Subject: Re: [FT897] batteries

Thomas and All:

That's true as long as you're running near the standard "20 Hour" rate, that you are willing to discharge the battery that far for each cycle, and that the radio is happy with the near full discharge voltage under load. In reality you're not going to see anywhere near the approximation you make unless you are significantly under-loading the battery.

One related note is that the quiescent state (resting without current) for a battery at 25% discharge is about 12V. When you load it, you're going to have something less than that. So if your radio needs some 12 Volts to operate well, you're either only going to be using 50% capacity or using a battery booster. If you use a battery booster, it will consume more current as the battery charge decreases, which will also decrease your usable time.

Note that batteries are often rated at their "20 Hour" rate. A 100 AH battery should therefore test to 100 AH at a discharge rate of 5 Amps. If you draw more, the total AH available will be less. If you draw less, the total AH available will be more. So, if you're using an FT-897 at 50 Watts and drawing some 12-13 Amps (simply a guess, probably more) then you may see the overall AH rate only if you also do some considerable receiving in between.

So, all this stuff affects your total usable time. How much you want to beat up your battery (it's not a good idea to regularly do a 100% discharge on some batteries), how much current you'll be drawing, what your TX/RX duty cycle is, whether you're using a booster, and even what temperature it is will all make a difference.

I think in the end when you look at lugging batteries around and how much use you might get out of them, QRP starts to be very attractive!

Weight for weight, I think you're farther ahead lugging antenna stuff
with lower power than battery stuff with higher power. This is also why
many military manpacks are 20W maximum.

Is it MAH or AH? I was under the impression MAH meant milli-amp-hours! You need to measure the draw of ALL equipment running and make calculations based on that. The draw of the 897 at 50watts (FM or AM) is between 15 and 20 amps. Not sure what the TNC draws, but the 7800 also draws about the same at 50watts as would the ft-100. Several batteries is always a good thing, but my guess would be one battery with all those radios transmitting (and no, not necessarily all at the same time) the amount of time you will have on that battery most likely will be about 2 hours, depending on how much you are TRANSMITTING. If mostly just listening, you may get much more out of it since receive doesn□t draw much. I would turn off the backlight as well to keep consumption down.

How much you want to beat up your battery (it's not a good idea to regularly do a 100% discharge on some batteries), how much current you'll be drawing, what your TX/RX duty cycle is, whether you're using a booster, and even what temperature it is will all make a difference.

I think in the end when you look at lugging batteries around and how much use you might get out of them, QRP starts to be very attractive! Weight for weight, I think you're farther ahead lugging antenna stuff with lower power than battery stuff with higher power. This is also why many military manpacks are 20W maximum.

From: Michael Walker (VA3MW)
Topic: 26362 Message: 26526

There is so little data moving, that the baud rate won't affect the performance.

If you are having some sort of bottleneck, I would look in a different area, like OS memory, swap space or graphics card.

Subject: RE: [FT897] Anyone use this radio with HRD

I am running the iogear usb to serial adapter and for some reason, I can only get HRD to see the radio at 4800 baud. I definitely think it would work better at the faster speed but for some reason I cannot do it. Perhaps with an old computer and a real serial port. Or I can possibly ad a Lava serial card to my machine. I never thought I would have to go back and use serial again--(

Aristotle Zoulas, KC2GBS, Warwick NY

BTW, great info, more than I got on the HRD group.

I've not had this problem with mine. I am running my radio at 38.4Kbps between the rig and PC though. The default is 4.8Kbps. You may want to up the speed of communications between the rig and PC so that there's not so much waiting as commands are exchanged. You'll also notice that HRD responds extremely quickly when you are running nearly 9x faster than standard

Subject: [FT897] Anyone use this radio with HRD

Hello, I am having a problem where when I move the slider on Ham Radio Deluxe, there is a momentary mute of the sound (about 1/100 of one second). Its enough to be a problem as I cannot continuously change the frequency to

tune in a station. Works fine from the radio. I posted a similar question on the HRD group and a few people said it was a common problem with the FT-857/897. Some people said they had to sell their radio because of this problem as they liked the program so much.
Any Help, thanks

Aristotle Zoulas, Warwick, NY.

Obvious question, Ari, but did you set the radio to 38400bps in Menu
019, "CAT RATE"?

Subject: RE: [FT897] batteries

Is it MAH or AH? I was under the impression MAH meant milli-amp-hours!
You need to measure the draw of ALL equipment running and make
calculations based on that. The draw of the 897 at 50watts (FM or AM)
is between 15 and 20 amps. Not sure what the TNC draws, but the 7800
also draws about the same at 50watts as would the ft-100. Several
batteries is always a good thing, but my guess would be one battery with
all those radios transmitting (and no, not necessarily all at the same
time) the amount of time you will have on that battery most likely will
be about 2 hours, depending on how much you are TRANSMITTING. If mostly
just listening, you may get much more out of it since receive doesn't
draw much. I would turn off the backlight as well to keep consumption
down.

Subject: Re: [FT897] batteries

Thomas and All:

That's true as long as you're running near the standard "20 Hour" rate, that you are willing to discharge the battery that far for each cycle, and that the radio is happy with the near full discharge voltage under load. In reality you're not going to see anywhere near the approximation

you make unless you are significantly under-loading the battery.

One related note is that the quiescent state (resting without current) for a battery at 25% discharge is about 12V. When you load it, you're going to have something less than that. So if your radio needs some 12 Volts to operate well, you're either only going to be using 50% capacity

or using a battery booster. If you use a battery booster, it will consume more current as the battery charge decreases, which will also decrease your usable time.

Note that batteries are often rated at their "20 Hour" rate. A 100 AH battery should therefore test to 100 AH at a discharge rate of 5 Amps. If you draw more, the total AH available will be less. If you draw less,

the total AH available will be more. So, if you're using an FT-897 at 50

Watts and drawing some 12-13 Amps (simply a guess, probably more) then you may see the overall AH rate only if you also do some considerable receiving in between.

So, all this stuff affects your total usable time. How much you want to beat up your battery (it's not a good idea to regularly do a 100% discharge on some batteries), how much current you'll be drawing, what your TX/RX duty cycle is, whether you're using a booster, and even what temperature it is will all make a difference.

What's down that low? Anything worth listening to?

Adam
Kg4wwh

It's an amateur band (at least here in PA country / Europe). And quite a challenging one too. I have seen setups where they use a HIFI PA to generate 100+ watts at 137 KHz, a antenna loading coil 1.5 meter high and 50 cm in diameter with LOTS of windings.

Of the 100+ Watts only a few milliwatss are actually radiated due to the extremely low antenna efficiency. I think coherent CW (or one of the more modern digital modes) are used to make QSO?s.

Topic: 17604 Message: 26531

FYI- The other weekend I took mt FT-897D w/AT-897 and a mini buddiepole to the beach in Walton County, FL. I brought with me a fully charged, fairly new marine starting battery. I operated at full power (100W) for approx 6 hours. Made a moderate number of contacts. The voltmeter on the radio (rx) showed 12.7VDC when I started. When I finished the voltmeter showed 12.5VDC after 6 hours.

That is my actual experience... no calculations, just operating and watching.

I was very impressed and realized I can operate for a long time on a good battery. (The battery is normaly connected to a charger outside my shack and operates a commercial radio for the local FD ops and is backup power for the shack as a whole).

Good luck.

26532. Want to Sell: FT-817 & HF Packer Amp

Yahoo group: FT897 (2009)
Date: 2009-06-23 12:31:31 UTC
From: bigv316@ymail.com
Topic: 26532 Message: 26532

Yaesu FT-817 & HF Packer Amp

Ft-817 (non ND) PLUS HF-Packer 50 watt amp kit (partially assembled.)
This is a complete station everything you need to get on the air.

This HF-Packer amp has been upgraded to latest model and most of the first board has been completed.The kit itself is valued at $240.00.

* W4RT DSP installed is $169.00
* Palm Radio Peg-Leg $20.00
* Finger Dimple Kranker knob $20.00
* Battery power cord
* Cigarette lighter power supply
* A/C power supply

That means you can hook it up to almost any power source right out of the box.
And that's not all (I've always wanted to say that!) a carry bag and the FT-817 Pack-It reference are also included (That's another $35.00 VALUE)
The only thing that's missing is the 6m extension to the OEM antenna. I never used it so it got stored somewhere and as soon as I find it I will mail it to whoever buys the radio. When I first bought this radio from another ham I sent it to Yaesu to make sure everything was working right and believe me this is one great little rig. This radio has a very wide receiver and is unbelievably quiet with the w4rt DSP turned on. You are going to love this little rig.
Guaranteed NOT to be DOA.

I am asking $895.00 plus shipping for everything. I am not looking to sell anything separately
I need to sell it all together. Please email me for pictures at
bigv316@... or call 863-398-6243 with questions.

Thanks,
Vince KI4HSK

Correct. AFAIR when opened up by either software or hardware mod (later
model D's) it can transmit on every frequency it can receive, but only
above 1.8 MHz with the exception of the air band..

ehm AM broadcast as in AM Medium wave (500 to 1800 KHz or about)? This is
lower than the 1.8Mc I mentioned as lower limit.
As for Shortware AM broadcast bands, when 'openend up" the 897 can certainly
transmit there.

The signal to noise ratio is significant...Every Friday evening the
local 10 meter net meets and once again I start on my 897d for
comparison and can only tell there is a station there...I switch the
antenna to my TS2000 and have a qso with the same stations...This isn't
as noticeable on lower bands because signals are generally better...

Eham list the TS-2000 at a RRP of $2300, so it should perform a lot better. I see a couple of UK listings at £1400. That's a lot more than the 897.

Still, from what I've seen of a Kenwood in action and the feature list I'd certainly consider the TS-2000 as a main station radio if I had that kind of budget to spend on it, maybe replacing the 897 with an 817 for portable due to its size and battery as standard. I've done quite well with the 897 on its minimum power settings that the low power isn't so worrying now, though the antenna makes a lot of difference. I'd also look at some of the higher end Yaesus and Icoms if I were to want to spend the money.

If that is the case then I would suggest that you have a fault on your
FT897, or there is some other problem that is causing such a significant
difference.

I've asked a few times on this list what the secret
is in running MT63 mode with an FT-897D and
SignaLinkUSB soundcard interface ..

TaDa !!

The Secret is to move the SignalinkUSB sampling rate from
11025 Hz to 12000 Hz . !!!

Probem solved ... works fine !! ..

I've noticed different antennas make a difference too, as well as location within the home and the general area in which I live. So, there are several factors that can be considered when it comes to noise. As many people forget, vertical antennas are noisier than horizontal ones too.

Yeah, that's in the Signalink manual. It says not to run the box at 11025. :-)

Well I did a side by side comparison between my FT897 and an FT1000, as well as an IC-7000, and there was no disernalble difference in the sensitivity or noise floor between any of the radios. The specs for the TS-2000 is certainly no better than the FT1000, so if an 897 falls well short of similar performance then there must be a fault or some other factor at play!! Try comparing the sensitivity specs for the 897 with the TS-2000. That is not to say that the 879 may not have a poorer rx spec in some respects, but not in ultimate sensitivity or noise floor.

I have been considering "upgrading" from my FT897. I find that
listening to it for a period of time is annoying because of the
noise, particularly on 10m and 6m.

Looking at the literature, it seems that the main difference is
in the filtering, particularly the IF filtering. The noise
reduction (DSP) may be better, and that would not show up as
a spec difference. There may be a roofing filter which would
help with interference from a nearby signal. (You would find
out how well that works this weekend!)

I'm holding off until I get a better antenna. I'd also like
to sit down at HRO and compare the radios myself to see if
there enough of a performance difference to justify the expense.

For any comparision, the settings are crucial. You want to have
the radio set to its best performance. It would be helpful to
have someone operate the radio who has experience with it.

A simple S/N comparision is not the whole story when comparing
radios.

I completely agree. I am new to digital radios, and have no idea what some of the settings are. I have searched all over the Web for a config guide that might help me set up the many parameters of this radio. The manual explains what the settings are, but not how the various options will affect the radio. While I have no problem with my FT-897D (matter of fact I love it), I know that it would probably perform better if all of the settings were set up correctly.

26548. RE: [FT897] Re: Audio quality (Using the 897D at home)

Yahoo group: FT897 (2009)
Date: 2009-06-25 18:15:02 UTC
From: D. F.
Topic: 26437 Message: 26548

Once again, there are many factors to consider when it comes to noise. 2 that stand out most, to me, are the antenna AND physical location of the rig. The ONLY way, really (IMO), to test for noise, is to take the rig(s) out in the middle of nowhere, where there is NO possibility of ANY interference, and test it that way. The power lines within the home, outside and in the area, again, can give noise that is sometimes un-bearable. I know, I've been through it. Also, don't forget if you may be close to a business or mfg center, the noise will increase, too.

Much of the noise you hear from the rig is man made. Thing is, there is usually so much of it (especially in an urban or suburban setting), it sounds like just loud "white noise" and not normal "static", so to speak.

Antennas, too, can make a difference.

To simply test a rigs side-by-side at the store really won't give you an accurate "measure" of noise, either. The store uses different antennas than you most likely do (considering space limitations, they most likely use vertical antennas) and this makes a difference too, since vertical antennas pick-up more man-made noise than horizontal antennas.

To limit noise and hear the most stations possible and save a few bucks too, I suggest fabricating your own antenna(s) specifically for the band(s) you want to use, and use horizontal antennas (if possible). Commercially made antennas are "broad-banded" antennas. Most are sold under the guise of ham radio antennas, but are used in MANY commercial applications as well, since many of "our" frequency allocations fall within business, commercial or government allocations. Since this is the case, they work, but are FAR from efficient for what we use them for and usually require us to use tuners to get the SWR want.

All the filtering and adjustments in the world won't help much if you cannot limit what the radio "hears" as far as noise goes. Chances are, too, the mfr uses far more efficient antennas than we do for their "spec tests".

One final thought - I find it interesting that many of us as "hobbyists" are so averse to making something on our own (antennas), that we would rather spend more money to make something work and not get the results we seek, then turn around and call the item "crap" or something similar. It takes little money (most times a fraction of retail cost) and less effort to make an antenna that will work they way it should, where you want it to work. Geez, why did you study for the test for?!?!?! Why does the ARRL publish their Antenna Book? But, if most of you would rather spend a few HUNDRED dollars for an antenna that MIGHT work right,

have at it. Just stop complaining about all the "side-effects" from it! With the current economy, does it not make more sense (and cents!) to save money where possible?

Just my thoughts!

I'd say Dennis nailed it with his statement regarding measuring noise figures in a noise-free environment. I've resorted to installing triangular loops a hundred feet out in the woods for 160/75 meters to escape the ever growing roar of little switching supplies, routers, modems, DSL noise propagation, furnace ignition noise and the assortment of electrical appliance buzzsaw noises that come and go, even out here in the sticks.

To be honest, my 897D hears everything that my Pro III can hear when using a quiet antenna. It will dig out a threshold signal just as well, but unfortunately, the menu driven IF shift and DSP adjustments are awkward to adjust on the fly. With front panel controls that larger rigs provide it is easier to dig a little deeper for those signals. I have arrived at receive IF shift settings and DSP settings that work for me in most situations, but everyone will need to play with their 897D on their own to optimize what they are hearing.

The only valid comparative tests for noise figures are those carried out with lab equipment in a controlled environment. Anything else done in the field is going to be a subjective comparison.

I had a friend who was ticked off by the noisy reception he was experiencing with his new rig. I asked him if he had line noise, and he said that he had none. When I stopped by, I saw his S-meter sitting at S-9 with no signal on 75 meters. From the steady repetitive spark noise it was obviously line noise, but when I explained it to him he simply said, "It's not line noise, it's always like that." I shrugged and let it go, but sometimes you need to come to the realization that even a simple dipole can be a real noise collector.

All:

Short answers on noise. (OK, not so short.)

1) If you disconnect the antenna and the noise goes away, it's not in the radio.

Exception: Possible overloading of some circuit or components in the radio.

2) If you have a strong signal that has a level significantly above the signal level you see when they're not transmitting, then it's not a noise issue but rather the sound of the signal.

Exception: Possible distortion of received signal due to radio problems or adjustment or improper use of ALC/AGC, filters, or noise blanker.

3) If you are receiving very weak signals and have everything turned way up, there may be some noticeable differences between radios. There may also be some low-level audio chain noise in some radios.

4) If you're using an LDG tuner that's attached to a radio and you're comparing it to another radio without the same tuner attached, try comparing without the LDG tuner connected. (You need to completely disconnect it from the antenna connection and plug the antenna directly into the radio.)

Explanation: I don't have an AT-897, but I do have other LDG tuners, one of which had a problem in which noise local to the radio (i.e. computer, displays, etc...) can induce noise into the power/control cable and raise the noise floor multiple dB. That was fixed with a simple modification. Perhaps someone with an AT-897 can test this.

Right you are, Rob. Your friend is ignorant to the fact that "interference" does not have to be, let's see - how to put it, like the "ignition noise" found in a lot of mobile applications. Want an example? Do a little HF work during the day in an urban/suburban environment. Then hit the same bands around midnight/1am. You will most likely see a drop to almost half of what the noise is during the day (using an S9 "noise floor" as a daytime example) just because power consumption in the area has dropped off (assuming most pesky neighbors have gone to sleep).

I also forgot to mention that when you go to the store to side-by-side compare the rigs, the store is 99% for sure in an urban setting with commercial power connections to the building in an area where there is HEAVY power consumption to boot!

Besides antennas, you can put a ferrite ring on the power cord to the power supply AND either a ring or filters on the line supplying the rig. It will help SOME (in most cases you may not even notice).

Anyway, if most were to change the antenna, or in many cases, simply try better feed-line, they may get better results instead of labeling a radio as "garbage - too much noise!".

Knowing your operating environment is just as important as looking at the specs of a radio. Limiting the effects of interference (what your radio hears) is the trick. Better sensitivity, noise rejection, signal to noise ratios, etc. don't mean squat if you are in an environment that is just plain "noisy".

At this point I can't remember exactly what the seminal poster posted :) but my feeling for quite some time has been that the 879d has a good receiver, on par with about everything else, but that the audio ends up a bit harsh, and that makes the noise more annoying to my ears.

I dearly love that radio, and have put a lot of airline and field miles on it, and it's going out again this weekend, but I can think of lots of radios with (what I suspect but can't measure) have better/cleaner/mellower receive audio, especially my Ten Tecs and TS870.

I agree with you 100% Jeff. I use the Optimus or RCA smaller book shelf speakers (3 inch woofer) for each of my rigs. They sound just great! This improves the audio 300% If you don't want wide audio, you can narrow it with the DSP filter.

You will surprised at what a quality component will do for sound no
matter the source!

X 2. The audio quality is actually decent with a good speaker.

I find it interesting how everyone's ears are different and respond to differing frequency ranges. I personally prefer a restricted audio range for ham communications and don't find the response of the internal speaker on the FT-897D to be a problem.

So, I guess the moral of the story is that everyone should experiment with various speakers and headphones and find the one that works the best for them.

Well, that's a valid point. I'm not so sure that a better speaker with a wider frequency response is actually improving SNR from a mathematical view, after all you are picking up additional noise with that additional signal. For me it "sounds" better. But if you were to say "but you aren't actually decoding more of a signal than you were with the stock speakers" I really couldn't disagree from my experience.

Perhaps the difference in preference is between those receiving louder signals where the expanded bandwidth "enhances" the experience versus those trying to pick out weaker signals where SNR is the primary concern? Also it is possible that this is an age related issue. If you can't hear those higher frequencies then the speakers response on the higher end is wasted (and I'm at the age where they are starting to fade myself.)

A friend of mine, who also has an 897D, loaned me a wide range speaker identical to the one he likes. I found the extra 'noise' from the full-range speaker to be distracting and gave it back to him.

It could well be somewhat age related. But again, different folks have varied hearing responses to aging, so I'm not sure that we can draw any significant conclusions based on age alone. I'm 58 (for the next week) and had my hearing tested about six months ago. I can still hear up to about 17 KHz. When I was 18, I could hear up to 22 KHz (but they called it "kc" back then <G>).

Personally, I think that it's simply a difference in the way different folks hear, and perceive, the various frequencies in any given signal. So, keep experimenting with speakers and headphones and find the one that suits you the best.

For example, I have a Heil ProSet 5, which I wear with one earpiece pulled back off my ear and I don't plug in the earpiece plug. I talk on the Heil mic, but listen on the 897D speaker.

Geez...I mean...all of these possibilities...The radio has a built in Preamp...I'll never understand that thinking...As does the TS2000 but its automatically off not on...Its the preamp thats inserting the extra noise in my opinion...My 897 hears distant electric fences that my TS2000 doesn't...Its a noise magnet...

Sound can be improved on but when the noise is louder than the signals
its not a sound issue...

Gary:

This is probably a matter of semantics. Certainly you don't mean to imply that a radio should not have any RF amplification before the mixer, do you? From the way it looks in the schematic, the FT-897's "preamp" is just that, an RF amplifier in front of the mixer. When that's switched out, there's no amplification in front of the mixer.

I wouldn't go blaming that RF amplifier without good evidence, particularly with what I know about the switching issues before it. It's also a good thing to have a good amplifier before the mixer for situations where there's less band noise and you can use the extra gain.

That you can hear distant electric fences on the 897 and not on the 2000 may be word in favor of the 897. This may simply be a matter of blanker adjustment or other setup. Turn off the noise blanker on the 2000 to see if it hears that noise also? Does it hear it with the 2000's "preamp" on?

I wasn't implying anything other than a preamp should be turned on not off by default...I've tried it every way possible...I've shut the entire house off...Its still a noisier radio...I'm not gonna sell it because its tolerable...I like it...But its no TS2000 but then its 1/3 the price of my 2000X...

From: Steve Yates
Topic: 26437 Message: 26564

I prefer my Radio Shack communications speaker for CW, SSB, and narrow band FM and a hi-fi speaker for AM and FM broadcast. Therefore, I built an external switch and mounted it under the shelf to switch between the two. Solves the problem as there is no one speaker for everything. DSP on the hi-fi helps but it doesn't have the punch of the communications speaker.

Steve - AA5TB

26565. FT-897D Cracklin Receive Audio on FM

Yahoo group: FT897 (2009)
Date: 2009-06-27 02:08:03 UTC
From: morseham
Topic: 26565 Message: 26565

Recently my fairly new (under 2 years) 897D has developed a crackle in the receive audio on FM (5.0 kHz). The problem is intermittent and un-nerving. It occurs with and without an external speaker. The speaker jack has been inspected and bypassed. The problem persists. It also occurs whether the receiver is squelched or un-squelched. This is not the crackle that is heard on a weak FM signal. This is definately internal to the 897D. I have not noticed it on other modes (admittedly, I normally do not squelch non-FM modes). It is also noticeable when the CTCSS decoder is ON and there is no signal.

Dan, did you ever get an answer to this question? My 897's battery lights started blinking just as yours did. started tonight,, after I got home and there had been a thunderstorm in my area, which also fried one of my computers! is there a way to stop the battery light from blinking?? thanks, Herb K1LOG

Hi,
My hearing upper end is still quite good for a geezer and yes, if using a good wide range 'hi-fi' speaker the audio amp noise is annoying.... unless the [DBF] is active and limiting the upper end band pass. Then the 897D audio quality through a hi-fi speaker is just as good as any rig I own. Comparison tests were done A-B, side by side with several good HF receivers listening to both SSB and HF/MW broadcast signals.

Out of the box the 897 [DBF] upper end is (I think) set to 6 KHZ which just pumps through white noise on the audio chain.

The [DBF] or digital bandpass filter needs to be set to limit the upper end frequencies. I have my audio band pass set to 240 hz bottom end, mostly to eliminate transmitted repeater PL tones, and the high end is set to 2400 to 2800 hz depending on the signal quality coming in. Even on UHF/VHF FM the upper end audio is usually not much better than 3 KHz anyhow.

Try it, You'll like it. ;-)

Let me wade in here... John's suggestion is very good. As a musician I like listening to music on hi fidelity speakers, a system that covers the entire frequency range of the music. But we are not listening to music with 20-20khz range. We are listening to voice, for the most part, transmitted by radio. The bandwidth of the desired signal is only about 3 khz, 3.5 khz max. And we do need the higher frequencies as they are what gives intelligibility to voice. Loss of high frequency hearing is why we go "huh?" when people speak to us.

So everything outside of that passband is noise. I had a Radio Shack Minimus 77 hooked up for a while. This is a nich bookshelf high fidelity speaker that has a 5" woofer and a 1" dome tweeter for a great top end. But that just passed too much noise. I now have some little 2"x4" oval speakers, they look to be identical to the Icom 23's, I purchased from a fellow on QRZ, that just will not produce much if anything below 250 hz or above 4 khz. They are in effect, a filter themselves.

Setting the 897 DSP's low end cutoff higher, and the high end cutoff lower, to about 3khz (I forget the exact hz setting) is a big help.

Still better, I have the BHI 1061 DSP installed internally. This is a huge improvement over the 897's. Listen to the mp3's in Files > AE5JU folder > BHI DSP subfolder.

But there is no use reproducing anything outside of the voice frequencies. The 897's DSP can be turned off when listening to the AM/MW band.

Hi Paul,

Does this occur on all bands? The reason I ask is that here in Texas the military EPLRS causes a similiar interference on 70cm that many folks mistaken for natural QRN.

Hi Steve,

This problem is INTERNAL. It is not an over-the-air issue. I only wish that it was that simple.

However, it is of major interest on the two meter band. I am attempting to see if it shows up on 440 or others. This Field Day weekend will be having lots of signals on all of the bands and give me a chance to find out. Although, since the problem is internal, it would seem to follow that it would show up on all bands.. It just showed up when I was on a MARS VHF frequency. (It is not on the MARS equipment as verified with other equipment in my station).

Paul's comment is spot on.

If you are new to the hobby, there are a couple of things that you need to keep in mind. The largest one is bandwidth of the audio. Yes, SSB is very maxed out at 3khz and it is very normal to be as low as 2khz - starting at almost 0hz. So, you might find the internal speaker a little thin. In most cases, the internal speaker is added as only a courtesy so that you can actually hear something when you first turn the radio on when you get it out of the box. J

In the car, or even the shack, then you need to jump up to about 4" or so. Just so you can actually hear it in a noisy environment. Or, headphones (or, in a car, even an ear piece). I know in Ontario it is not against the law to wear complete 2 ear head phones while driving (I used to use a David Clark headset/mic for both my cell and SSB radio while in my convertible). If you aren't sure about your local laws, then check. - I know that is going to spin off into another entire off topic discussion (I'm pretty sure you can be deaf and get a drivers license, but I digress).

FM is much higher bandwidth. 15khz.

Even though you can pump up the bandwidth to 6khz for ssb in the receiver, often less than 2.5khz is being transmitted. Sort of like feeding water from a 1" pipe into a 3" pipe. The rest is air (or noise).

Hope that makes sense. Have faith that the guys that build your radio actually knew what they were doing. It isn't just a 'toaster'. J

Then the 897D audio quality through a hi-fi speaker is just as good as any rig I own. Comparison tests were done A-B, side by side with several good HF receivers listening to both SSB and HF/MW broadcast signals.
>
> Out of the box the 897 [DBF] upper end is (I think) set to 6 KHZ which just pumps through white noise on the audio chain.

>
> The [DBF] or digital bandpass filter needs to be set to limit the upper end frequencies. I have my audio band pass set to 240 hz bottom end, mostly to eliminate transmitted repeater PL tones, and the high end is set to 2400 to 2800 hz depending on the signal quality coming in. Even on UHF/VHF FM the upper end audio is usually not much better than 3 KHz anyhow.
>
> Try it, You'll like it. ;-)
>
> John WA0LHB

Let me wade in here... John's suggestion is very good. As a musician I like listening to music on hi fidelity speakers, a system that covers the entire frequency range of the music. But we are not listening to music with 20-20khz range. We are listening to voice, for the most part, transmitted by radio. The bandwidth of the desired signal is only about 3 khz, 3.5 khz max. And we do need the higher frequencies as they are what gives intelligibility to voice. Loss of high frequency hearing is why we go "huh?" when people speak to us.

So everything outside of that passband is noise. I had a Radio Shack Minimus 77 hooked up for a while. This is a nich bookshelf high fidelity speaker that has a 5" woofer and a 1" dome tweeter for a great top end. But that just passed too much noise. I now have some little 2"x4" oval speakers, they look to be identical to the Icom 23's, I purchased from a fellow on QRZ, that just will not produce much if anything below 250 hz or above 4 khz. They are in effect, a filter themselves.

Setting the 897 DSP's low end cutoff higher, and the high end cutoff lower, to about 3khz (I forget the exact hz setting) is a big help.

Still better, I have the BHI 1061 DSP installed internally. This is a huge improvement over the 897's. Listen to the mp3's in Files > AE5JU folder > BHI DSP subfolder.

But there is no use reproducing anything outside of the voice frequencies. The 897's DSP can be turned off when listening to the AM/MW band.

ALL,

This problem occurs on ALL bands WITHOUT either antenna connected. It is most noticeable in the AM mode. It is not there when the receiver is in FM and the CTCSS/DCS decoder is active. It is there in the SSB modes but hard to hear. It is constant and sounds like a constant static crash of constant amplitude. It is causing the S-meter to respond to about 50% of full scale indicating a probable location in the IF area. Remember it is HF through UHF so the Antenna switches and RF front ends are not the cause. It is somewhere in the common area of the receiver(s).

This Field Day weekend will be having lots of signals on all of the bands and give me a chance to find out. Although, since the problem is internal, it would seem to follow that it would show up on all bands.. It just showed up when I was on a MARS VHF frequency. (It is not on the MARS equipment as verified with other equipment in my station).

It occurs with and without an external speaker. The speaker jack has been inspected and bypassed. The problem persists. It also occurs whether the receiver is squelched or un-squelched. This is not the crackle that is heard on a weak FM signal. This is definately internal to the 897D. I have not noticed it on other modes (admittedly, I normally do not squelch non-FM modes). It is also noticeable when the CTCSS decoder is ON and there is no signal.

26575. lining up rx on my 897

Yahoo group: FT897 (2009)
Date: 2009-06-28 08:50:32 UTC
From: Darren S
Topic: 26575 Message: 26575

Hello. My 897 suffers from deafness on 70cm. Investigations revealed that it could need lining up and for that matter the s- meter on ssb is non-existant too. for the rx problem i find that i can line it up in the alignment menu. For it i need a signal generator set at 0 DB into the antenna socket. I have a signal generator but i don't get the 0 db reference

"
RX Gain Adjustment
a. Select the CW mode. Tune the transceiver to 1.8MHz band. Select “HF1RXG” in the menu by rotating VFO/M-CH knob. Inject a RF signal from a signal generator at 2dBu output.
b. Set the parameter “HF1RXG” at the value of lighting the first dot of the S-meter (S1) on the
LCD by rotating the main dial.
c. Other RX gain adjustment should be performed as this routine. Output levels of the signal
generator at each frequency are shown as follows.
Frequency Output Level of SG
1.8MHz Band 12 dBu
7MHz Band 12 dBu
21MHz Band 9 dBu
50MHz Band 0 dBu
144MHz Band 0 dBu
430MHz Band 0 dBu

"
the menu selection i think i need is UFFRXG. I have a signal generator but it has no DB indicator of any kind on it and i looked up DB 0 on google and it's describes as audio threshhold. Can I do this operation with a sg gen without DBu indicator or should i see if i can get a SG with one???

Thanks

Hi Ted,

With regard to the voltage regulator, I was thinking that the voltage regulator would be necessary when the voltage drops on transmit.

My understanding is that deep cycle batteries can be damaged if the voltage drops below 10.5v, and you don't want the voltage to drop below 11.5v to avoid excessive calcium buildup.

For psk31, I'm seeing my voltage drop to 11.6v on transmit using a fully charged 100AmpHr after say 1/2 hr of psk31 operation where I've cut back the transmit power to 40watts.

Do you run psk31 from a battery using the 897, and if so how many amp-hours of battery capacity do you use?

Thanks,

Ron

Subject: RE: Re: [FT897] batteries-12 volt, 6 cell, lead-acid vs FT-897

Ron,

Shouldn't be any reason for the BATTERY voltage to exceed the limit - just not possible.

However, if your charger were to put out excessive voltage it could damage the rig. It would also likely fry the battery if left high for very long.

So the control issue if the charger circuit. The charger should limit voltages to what is appropriate to the battery.

There should be no upward swing on transmit but there is likely to be a voltage drop unless you use very large, short power leads..

There are some issues with charging a bettery from a typical ham power supply that involve damage to the supply when power fails but the battery reamins connected.

One simple solution is to use a computer UPS unit to charge the battery - float voltage will be OK for many marine batteries.

Hi Bob, kc3vo,

I'm interested in learning more about batteries, and am currently setting up to also run from a deep cycle marine battery. One thing that surprises me is that you don't see much mention of using a voltage regulator. There are products out there that shut the battery off if the voltage goes outside the range 11.5 to 15v in order to protect your equipment.

Without a voltage regulator, I'm concerned that my other equipment (ie tnc) will experience voltage swings during transmit.

Is it common to use a voltage regulator when operating a ham station using batteries? Do you recommend it?

Thanks,

Ron, KD0HNE

26583. Connection from CAT to LDG tuner for power

Yahoo group: FT897 (2009)
Date: 2009-06-24 18:46:26 UTC
From: zr1bob
Topic: 26583 Message: 26583

I have an FT-897 and am using the LDG Z-100 tuner. I want to power the tuner from the CAT/Linear jack
on the back of the radio and have converted a spare DIN cable to have the 2.5 x 5.5 DC plug on the
other end. I've connected into the 13.8 volt & ground connections for the DC plug but when I try to power
the tuner it doesn't appear to work properly, like it can't tune...it's getting power.
Is there some menu setting or something I'm missing here? I really want to power the tuner directly from
the rig so I don't have to use an external 12v power supply.
Any thoughts would be greatly appreciated.
Thanks

Hi Kirk,

How many AH was that battery?

Thanks,

Ron

FYI- The other weekend I took mt FT-897D w/AT-897 and a mini buddiepole to the beach in Walton County, FL. I brought with me a fully charged, fairly new marine starting battery. I operated at full power (100W) for approx 6 hours. Made a moderate number of contacts. The voltmeter on the radio (rx) showed 12.7VDC when I started. When I finished the voltmeter showed 12.5VDC after 6 hours.

That is my actual experience.. . no calculations, just operating and watching.

I was very impressed and realized I can operate for a long time on a good battery. (The battery is normaly connected to a charger outside my shack and operates a commercial radio for the local FD ops and is backup power for the shack as a whole).

> That is my actual experience.. . no calculations, just operating and watching.

Yesterday for Field Day I operated at 100 w LSB on 40 meters. I used an RBC-6 pack, which is two 12 v 12 AH sealed lead acid ("gel cell") batteries in parallel for a total of 24 AH. I left a digital voltmeter connected to the battery terminals the the whole day. I powered up, and at the beginning, receive, measured 12.88 volts, with the voltage dropping to just under 12.8 volts on transmit. By mid afternoon, 12.8 volts recieve, around 12.7 volts transmit. When I shut it down about sundown 12.7 volts receive, 12.6 volts transmit.

All contacts were made with my radio. They were having problems with the other radio and antenna and never resolved the problem. Meanwhile various operators took turns making contacts and logging QSO's on mine, on batteries. Never connected any of my gear to the generator, though it was nice to power the fans and get the air moving a bit.

These mostly appear to be RF getting back into the rig, or power supply problems. Most people appear to have been successful in eliminating the problem through normal RFI means, such as fixing problems with the antenna system, adding proper grounds, or adding chokes. Of course, RFI could be affecting the power supply itself, causing voltage to drop. Any wire into the rig, power supply, or connected equipment, including CAT or the mic, could be a path for problems.

Hi Ron,

I'm not sure now what you mean when you use the term voltage regulator.

A voltage regulator (except for "boost regulators" - really not a regulator) run from a battery cannot put out a voltage higher than the source from the battery. Indeed, typical regulator designs require at least 1.5 volts more than the desire output, often more. The solution is to stop discharge at that point. A regulator will not help with this unless it provides a cut-off function for low input voltage (some do).

There are a couple of boost devices available that can provide voltages higher than the input with perhaps 90% efficiency. These must obviously draw more power than they put out so useable amp-hours will be reduced. The key advantage is their ability to keep the radio supply voltage at optimum levels with the tradeoff being less battery running time. MFJ has a unit and there is another but I forget the supplier name. If you google 'boost regulator' you will find them.

Further, you are correct about low voltages and battery damage - you do not want to discharge most lead acid batteries below 11.5 v.

If you see a voltage drop down to 11.6 volts I would be suspicious of the battery. Some questions to consider are:

1. At what point are you measuring voltage? If you are talking about the ft-897 screen display the voltage would be at the radio end of the supply wire.

2. Is the voltage you mention during transmit or at idle? During transmit you need to measure the voltage at the battery to know you are not simply seeing drop due to wire resistance. You can calculate the drop in the wire using ohms law. You will need to find wire resistance and current draw.

3. What voltage recovery do you see when you stop transmitting? It is normal for battery voltage to drop during high current draw but it will normally recover very quickly once the load is removed.

It sounds to me like you might have a failing battery. You might consider having it tested. At 40 watts even with 100% duty cycle (highly unlikely) the current draw will probably be around 10 amps. If you are seeing a drop of 1 volt after one half hour at 10 amps there is something wrong. Even a starting battery will perform better than that. Note that when batteries fail it is common to see drastically reduced capacity - the battery appears to charge to full voltage (12.7 ?) but cannot supply many amp hours of power.

I don't run PSK31, so my power consumption is likely around 2/3 lower per hour.

Hopes this helps a little.

Ted

My understanding is that deep cycle batteries can be damaged if the voltage drops below 10.5v, and you don't want the voltage to drop below 11.5v to avoid excessive calcium buildup.

For psk31, I'm seeing my voltage drop to 11.6v on transmit using a fully charged 100AmpHr after say 1/2 hr of psk31 operation where I've cut back the transmit power to 40watts.

Do you run psk31 from a battery using the 897, and if so how many amp-hours of battery capacity do you use?

Thanks,

Ron

Subject: RE: Re: [FT897] batteries-12 volt, 6 cell, lead-acid vs FT-897

Ron,

Shouldn't be any reason for the BATTERY voltage to exceed the limit - just not possible.

However, if your charger were to put out excessive voltage it could damage the rig. It would also likely fry the battery if left high for very long.

So the control issue if the charger circuit. The charger should limit voltages to what is appropriate to the battery.

There should be no upward swing on transmit but there is likely to be a voltage drop unless you use very large, short power leads..

There are some issues with charging a bettery from a typical ham power supply that involve damage to the supply when power fails but the battery reamins connected.

One simple solution is to use a computer UPS unit to charge the battery - float voltage will be OK for many marine batteries.

Subject: Fwd: Re: [FT897] batteries-12 volt, 6 cell, lead-acid vs FT-897

Hi Bob, kc3vo,

I'm interested in learning more about batteries, and am currently setting up to also run from a deep cycle marine battery. One thing that surprises me is that you don't see much mention of using a voltage regulator. There are products out there that shut the battery off if the voltage goes outside the range 11.5 to 15v in order to protect your equipment.

Without a voltage regulator, I'm concerned that my other equipment (ie tnc) will experience voltage swings during transmit.

Is it common to use a voltage regulator when operating a ham station using batteries? Do you recommend it?

Thanks,

Ron, KD0HNE

For me, 10m and 20m are "problem" bands. They seem to be worst in terms of RFI.

Check some things: remove all external connections and run from a battery. Still have trouble? Does the problem happen on low power?

How big is your power supply? Plug a voltmeter directly to the supply when transmitting and see if the power supply is maybe overloading. I have had more than one PSU that stopped providing full power but still gave me 13.8 volts with no load. Soft failures like that are hard to spot and require you check all the variables.

As others have suggested, you may also want to try a dummy load. This is where it helps to belong to a club. Someone will have a dummy load and a spare power supply you can test with.

Hello group

i had a quite similair problem the other day at 100w on 80m the rig seems to reset itself switched off for a second or so

the problem turned out to be the the negative lead of the power supply cable wich was having a bad contact

26592. Great Field Day ending w/o a bill for $100

Yahoo group: FT897 (2009)
Date: 2009-06-28 21:24:27 UTC
From: k5btk
Topic: 26592 Message: 26592

As many of you may be aware, the CW keying circuits of the FT-897 and FT-897D are easily damaged by strong RF fields as exist when operating near a portable antenna. For those not familiar with the problem, a search of the FT-897 Newsgroup archives will reveal that multiple owners have had to return the radio to Yaesu for a $100.00 repair after operating in strong RF fields. On two separate Field Day outings my FT-897 experienced this failure. After the second failure I upgraded to an FT-897D. Thinking that the problem had probably been addressed in this model, I once again went to Field Day ... and killed the keying circuit. This made three times! In the first case, I was using a Maldol (20m) whip mounted directly to the coax connector on the radio rear-panel. In the other two cases, I was operating at a transmission line length of 25 feet from a Buddipole dipole approximately 15 feet above ground. The distance from the radio to the nearest point of the radiating element (depending on dipole orientation) was probably between 5 and 20 feet. Following the third trip back to Yaesu, the technician sent a ferrite choke to be placed on the keying lead at the male plug. But he suggested (tongue-in-cheek) that the only way to be SURE the problem wouldn't recur was to stop operating CW!

Anyway, what prompted this posting is that I HAVE JUST FINISHED FIELD DAY 2009 WITHOUT MISADVENTURE!!! I was using the Buddipole up 15 feet with its 25-foot long transmission line as I had in the previous two failures. But I ADDED 50 ADDITIONAL FEET of transmission line to get me 50 feet further away from the radiator. (I used the ferrite choke as well). Operation was on both 40m and 20m. I'm sure that people differ in their opinions as to what constitutes a successful Field Day. But for me, it was a day of fun operating CW outdoors making essentially effortless contacts and NOT ENDING WITH A FRIED RADIO.

In conclusion, if operating CW with the FT-897(D) - stay away from the antenna.

...Don (K5BTK)

Just because you get a noise without antennas connected, does NOT mean it is internal. Check closely around the house, and yes, even your neighbors. Is there anything new or does anyone have sone type of electrical device that may be causing it? It will most likely be something small such as patio lights, a touch lamp or something along those lines. I developed a similar problem where I used to live that popped up around thanks giving and went away about 2 weeks after New Years. Obviously a Christmas decoration of some type, but I never found it. Drove me nuts. Every band was wiped out including 2m/440.

Check again before tearing into that radio.

ALL,

This problem occurs on ALL bands WITHOUT either antenna connected. It is most noticeable in the AM mode. It is not there when the receiver is in FM and the CTCSS/DCS decoder is active. It is there in the SSB modes but hard to hear. It is constant and sounds like a constant static crash of constant amplitude. It is causing the S-meter to respond to about 50% of full scale indicating a probable location in the IF area. Remember it is HF through UHF so the Antenna switches and RF front ends are not the cause. It is somewhere in the common area of the receiver(s).

seem to follow that it would show up on all bands.. It just showed up when I was on a MARS VHF frequency. (It is not on the MARS equipment as verified with other equipment in my station).

It occurs with and without an external speaker. The speaker jack has been inspected and bypassed. The problem persists. It also occurs whether the receiver is squelched or un-squelched. This is not the crackle that is heard on a weak FM signal. This is definately internal to the 897D. I have not noticed it on other modes (admittedly, I normally do not squelch non-FM modes). It is also noticeable when the CTCSS decoder is ON and there is no signal.

From: Steve Yates
Topic: 26581 Message: 26595

Ed,

With N3FJP's software I just use the default settings for Yaesu. Make sure that the Baud Rate matches what is selected on the FT-897's CAT RATE, menu No. 019. Also, you may have to experiment to find the port that you are using. Here are my settings:

Select Rig: Yaesu
Use Frequency: [check]
Comm Port: 6
Baud Rate (k): 38.4
Parity: None
Data Bits: 8
Stop Bits: 2
Connection Power: RTS
Radio Polling Rate: 100 ms
Mode by: Rig
Convert from Hex: [check]

Some of these settings are just personal preference but I hope they help you. Also, I have found the hard way that the pins on the DIN connector for the CAT jack bend very easily so be sure and check them to make sure that they are straight.

Nothing helps it. The problem is that when you send the frequency change CAT command, the radio mutes. This has been discussed ad-nauseam on the HRD forums. It has nothing to do with data rates or anything else; it's got everything to do with the fact that this radio has lousy not well thought out CAT support.

Thanks for the input Dennis,

The problem is definately internal. I have other equipment in the shack that does not suffer from this problem. There is no new electrical equipment in my house.

I have completely disassembled the unit and tightened all of the ground/pcb mounting screws on both boards. Actually three boards. I also took the control unit apart and tightened all of those screws.

I also performed a tap test and removed the Collins filters. The problem still exists and is somewhere before the volume control. The tap test did not reveal anything remarkable. There was no change in the intensity of the noise. It does, however, change in pulse rate and intensity on its own. Its sound is not unlike that of a lightning crash. (No lightning within hundreds of miles).

Another quieting issue is that I live inside a Faraday shield environment (a mobile home with aluminum siding). It is electrically very quiet inside.

I also lived in a mobile home and they are in NO WAY a faraday shield by any means, mind you the interference did NOT originate from my home. Had to be one of the neighbors somewhere in the area but could never find it. And, same as you, it changed in pitch, speed, intensity, etc. on its own. Also, no other equipment was affected. By the way, this was my 857, I don't have an 897, but since both radios are almost identical I subscribe here for information. Not much chatter on 857 group. So, again as I stated, you need to make DARN sure that it is not something else. I'll bet someone in the area recently bought some new piece of electronics that is giving you grief! Touch lamps are NOTORIOUS for causing harmful interference!

have you tried a different cat lead? mine doesn't mute on cat control.

From: Thomas Wilson <wilsontp@...>

Subject: Re: [FT897] Re: Anyone use this radio with HRD

Nothing helps it. The problem is that when you send the frequency change CAT command, the radio mutes. This has been discussed ad-nauseam on the HRD forums. It has nothing to do with data rates or anything else; it's got everything to do with the fact that this radio has lousy not well thought out CAT support.

<MOST, MOST interesting. Thank you for the posting. Fast question - do you have any knowledge about the details of that ferrite choke? Any info would be appreciated Frank (W1IVB)>

No info at all, Frank. Except that it is of the type which separate into two halves for easy clipping over the conductor and then snap back together. The length of the choke is 1.25" and the diameter is about 5/8". It probably helped - but I think the extra distance from the antenna was crucial.

Happy 4th! ...Don (K5BTK)

thanks for the responses

does it on internal PS and on Astron 35A PS, have not tried into dummyload, i'll do that next

but no VSWR warnings i tune the G5RV down to 1.5:1 or better typically
measured on a 259B

rig, tuner, etc are all grounded, but i will go through all that AGAIN just to be sure

I've not managed to blow mine up yet, even though I have a dipole end quite close to the station location. Bad for noise I know, but the limitation of a small garden.
I only run at low power though - 5 or 10 Watt normally, 20W once. My key to radio connection is with some spare RG58, so shielded as suggested somewhere, I think in the instructions for my first kit radio. They key has lots of unshielded metalwork though. Still, if adding a clip-on ferrite to the cable end is a good idea then it's a cheap enough thing to do. I could do it for my CAT and DATA cables too.

Topic: 26609 Message: 26609

You may say what ever about the Vertex people, but will never change my though of these great piople!
Having on the 10/06/09 talked vi phone that my unite FT857 was not brakeing the squlsh was informed to send it to ham repair, and now 29/06/09 the big brown truck backed in to my drive and handed me a much wanted box.
After getting all the paper stuffing out and my grubby fingers on the little black box was quite amaized that what all was listed on the repair sheet as
1 diode 0.30
Pa unit 418.30
2 diode 1.00
AM Pa labor 3 hours
Total cost to customer $00.00

Not even cost of return shipping
SO BEAT THAT WITH A STICK
Would say a big thanks to all the people at the vertex repair
Glenn K3HFR
PS yes I know that the FT857 room is down the hall but still ????

26610. Ferrite Beads for Field Day Coax

The chokes I use are the snap-on Ferrite Beads from Palomar Engineers.

http://www.palomar-engineers.com/

They are the FSB-1/4 (for RG-8X, aka "Mini-8"), and there are other sizes for other coax. These beads are snapped on as close to the feedpoint as possible. Mine are on the antenna end of the coax right up against the PL-259 plug.

Talking with the fellow at Palomar, for 2 meters one bead is adequate. For operation down to 80 meters, 5 beads are needed. For 160 meters, 10 beads.

Scroll down on this page to "Split Beads".

http://www.palomar-engineers.com/Ferrite_Beads/ferrite_beads.html

These are good if your coax already has plugs installed. If you are making up the cable, or have to change the plugs anyway, you can use one of these kits:

http://www.palomar-engineers.com/1_1_Balun_Kits/1_1_balun_kits.html

To keep the snap-on ferrite beads in place I slipped a band of heat shrink tubing over each one to make sure they stays snapped closed.

This is all much smaller than coiled coax ("choke balun") which also uses up about 20 feet of your coax and would have to be wound on a large bulky piece of pvc pipe. With the ferrite beads, and nice flexible (stranded inner conductor) Mini-8 it rolls up nicely in my kit.

Can't replicate your problem here.
No mute or loss of sound while using HRD to change frequency.

Do you have FT 897 Menu 85 OFF, Menu 20 at CAT, and Menu 19
at 9600 bps? (this is the default speed for most PC serial ports
and avoids annoying CAT 'hmm' on the 897)

My Equipment: FT-897 (year 2002 non-D), XP laptop,
Cat via AT-897 tuner box, 9600 baud

We were not very successful with the commercially made folded loop stretched from one tree (in the park) to the flagpole, and over to another tree.

On the otherhand, we made all contacts with my radio and portable antenna. Yes, it is a homebrew version (on steroids) of the Buddipole, just somewhat higher and a bit tougher.

It can be found here in Files > AE5JU folder.

or at Hamuniverse.com

http://www.hamuniverse.com/AE5JUHomebrewBuddipoleVariant.pdf

This is a pdf file (right click and "Save Target As") with photos and links to all the components.

The photo near the end is taken in the same city park, and near the same location as our setup for Field Day this past weekend.

HI Paul,

Firstly, a nicely put together description of the whole process of building the antenna and looks like you will have many happy hours with it.

You comment in the text about the fact that the two sides need to be different lengths to get the SWR right down.

I suggest that it could quite possibly be because the aluminium angle bracket is connected to the black end of the antenna so it becomes part of the antenna thus increasing the overall length of the black end with respect to the red end by about half of the bracket length. You are, in effect, moving the physical centre of the antenna to the red end of the bracket, instead of being in the middle of it.

I believe that if you were to insulate the connector from the bracket, you would probably find that the results would be much closer to being the same length on each side.

73....Eric VK2VE.

26616. File - FT897 Group Guidelines.txt

Yahoo group: FT897 (2009)
Date: 2009-07-01 07:24:42 UTC
From: FT897@yahoogroups.com
Topic: 5240 Message: 26616

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

Hi,
I have the same problem on my 897D. Found out from this group and looking at the HRD forum that the problem is when HRD sends a frequency change it sends the whole frequency value. When this happens the 897D will mute for a few milliseconds. Internally, the VFO knob simply adds or subtracts to the base step frequency already in CPU memory and the rig doesn't mute.

This feature makes it hard to use the HRD slider to scan across the bands. One work around is to use HRD to set the frequency desired and then use the VFO knob on the 897 and another is to use the data out port on the back of the rig for an audio source: appearently it doesn't mute when being driven by HRD.

(Eric is referring to my antenna here:

http://www.hamuniverse.com/AE5JUHomebrewBuddipoleVariant.pdf)

Eric, yes, I had thought of that, but also, the original Buddipole has the same characteristics and must be operated with assymetrical coil and whip lengths in order to get acceptable SWR (under 2:1).

But whatever the reason, the coil and whip dimensions given work well and I can get good SWR without tuner on 40, 20, 17, and 15 meters. I have not yet tried it on 12 and 10 meters, but it should work on those bands by using no coils, just adjusting the whips shorter.

The fun part was, with the assistance of one other person, I put up my antenna in about 10 minutes. (would have been 5 minutes by myself... hahah, it was a "show & tell" moment) Meanwhile, the rest of the club, using about 6 people, took about 45 minutes stringing up the folded loop. And if trees and flagpole had not been conveniently located where they were, well, who knows? But mine actually worked. ;-)

This is a wonderfully well-documented and well-conceived project.
Thanks for sharing the info! I have been operating "portable" with a
Yaesu ATAS-25 antenna, but find it very hard to make contacts with it,
so I think I am going to build one of these and try it out.

26620. Ferrite Beads for Key connection

Yahoo group: FT897 (2009)
Date: 2009-07-01 19:49:25 UTC
From: G. Hopper
Topic: 26592 Message: 26620

Beads on the coax at the feedpoing (of the antenna?) I'm now a little confused. I thought we were discussing the issue of putting a choke on the cable from the code key to the key plug on the radio, not the coax at the antenna. Did I miss something or are these going to be a good choice for an ordinary shielded pair (not feedline) and that just wasn't explicitly stated (for us slow folks)?

I was going to ask (and I guess I'm doing so now) if we ever reached any kind of consensus on what was appropriate as I wanted to make up a couple of cables for my key(s) that will protect my radio.

26621. WA7LAW field day VHF+ with 897d and Buddipole

Yahoo group: FT897 (2009)
Date: 2009-07-01 20:29:39 UTC
From: G. Hopper
Topic: 26621 Message: 26621

I just wanted to share a quick note regarding my use, or rather our experience (Snohomish County Hams Club, WA7LAW) with my 897 and a Buddipole configured as a 6 meter, 3 element beam at Field Day this year. I'm pretty excited about my purchase of this radio and am thankful for the help and advice I received (on and off list) and wanted to share my thanks again as well as my enjoyment at field day.

The whole idea of using this combo was a backup plan that became "the plan" when our main VHF+ guy never answered any emails and no one
really thought about what we would do on 6 and above for field day.
Fortunately, I had planned on getting on 6 a lot with this system so I had everything I needed, just no time to test it beforehand.

The whole antenna thing was somewhat of a guess, based on a previous design (with one unobtainable part- isn't that the way it always goes?) My Buddipole Deluxe is the "long" kit with the 18' mast, so the whole thing on the tripod stood a pinch over 20' tall, and once we sorted things out we ended up with a SWR of about 1.4 at 50.125 MHz according to my MFJ-269 (how did I ever get along without THAT piece of gear?)

What turned out nice about the buddipole (as many of you know) is that I was able to not only configure it and tune it by telescoping the elements, but also that I set it up on both 2 and 6 meters. I wanted to try it out on 10 and below but the other radios (we were 3A) were in pretty much constant use, at least until 11 PM.

We ended up with around 45 contacts on 6 meters, mostly up and down the west coast and into the southwest as we had a good opening (heard that it opened to JA land, but we never saw evidence of that.) The 6 land folks had an opening into the Midwest so that was pretty neat to listen to as well.

We also made contacts on both 6M and 2m on Sunday morning, including one CW QSO (and given that the antenna was about 30' away, I'm glad the use of the key didn't fry the radio.) My big frustration was switching the coax between the connectors when I went from 6 to 2 and back again (several times.) Since that was my big complaint I have to say that I was very pleased with the whole setup.

All that, coupled with a great computer logging program especially for field day (N3FJP's Field Day Network Log) made the whole event pretty great. I'm already planning some activations of local islands for the US Islands program and getting pretty darn excited for further summer adventures with my 897d!

Ted,

A couple tests and checks are in order here. First off, your power supply is not variable voltage, so we can eliminate the cat hitting the knob <G>

You didn't mention if both voltage readings were taken in receive or transmit mode. If it shows 13.8 in RX and 13.3 in TX, that's pretty much normal with just about any supply. You're always going to get a voltage drop on TX when the load goes from 1A to about 23A.

If it's dropped from 13.8 to 13.3 in RX mode, then we'll start looking. Get your digital voltmeter, set it to the 20 VDC scale, and check the voltage at the output terminals of the PS, with the radio on and in RX mode. Then key the radio, give it a test count (don't forget to ID ;-)) and read the voltage while transmitting. A half volt drop there would be normal and within the published specs of your supply.

See if the voltmeter readings agree with the readout on the radio. If they do, all is well.

Next, check the PS output under no load -- radio disconnected and then check the voltage at the radio end of the cable. If that's lower, you've got a cable problem and it'll be exacerbated when you're transmitting. Check for loose connections and repair or replace them.

If the above doesn't fix things, take notes and get back to us. Good luck.

The voltage reading should be made at the radio end of the cable. This
will show the voltage drop of the wire. The radio's display is can be
calibrated from a service menu to read the more accurately.

.5 drop under transmit is not bad.

1. Get voltmeter out of drawer and blow off any dust.
2. Rotate range selection knot to set voltmeter to 20 volts DC range
3. Disconnect power supply cord from FT-897.
4. Turn on power supply.
5. Insert red voltmeter probe into power supply socket for red wire.
6. Insert black voltmeter probe into power supply socket for black wire.
7. Observe readout on voltmeter.

DO NOT change that value. The problem may not be a problem, it may be normal operation. We don't know if he even has a faulty (probably not) PS. If you change the value in the radio, it may not read correctly if he connects to another supply later and may damage the radio because he now is getting an incorrect reading.

26635. Antenna Switch

Yahoo group: FT897 (2009)
Date: 2009-07-02 16:18:21 UTC
From: richardkd0gdv
Topic: 26635 Message: 26635

Hi, all. I have a question about using an antenna switch.

Here's what I have set up: I have a tri-band (144/440/6M) antenna and an HF antenna coming into the 2-antenna switch. Out of the switch I have one feed going to the HF side (where the 6M lives), and the other to the VHF side. I want to try more 6M, so what I'm doing is feeding the 6M signal from a 144/440/6M tri-band to the HF side without physically reconnecting antennas.

My MFJ1702C switch says, "Do not change position with power on the transmission line." My question is whether that's really dangerous to the radio. Since I switch HF to VHF bands frequently, I would think it's also hard on the radio's power switch to turn it off and on that often as I use the switch to change antennas.

73s. Thanks.
Richard

It is ok to switch when in RX mode. You don☐t want to switch while in TX mode. That is what they mean by ☐with power on the transmission line☐. While in RX, there is no power on the line.

Hi, all. I have a question about using an antenna switch.

Here's what I have set up: I have a tri-band (144/440/6M) antenna and an HF antenna coming into the 2-antenna switch. Out of the switch I have one feed going to the HF side (where the 6M lives), and the other to the VHF side. I want to try more 6M, so what I'm doing is feeding the 6M signal from a 144/440/6M tri-band to the HF side without physically reconnecting antennas.

My MFJ1702C switch says, "Do not change position with power on the transmission line." My question is whether that's really dangerous to the radio. Since I switch HF to VHF bands frequently, I would think it's also hard on the radio's power switch to turn it off and on that often as I use the switch to change antennas.

73s. Thanks.
Richard

Like he says , you don't have to turn off the radio to switch antennas.
Just make sure you aren't transmitting when you do it.

Thanks for the clarification. I knew there had to be a way to switch antennas without turning the rig off.

DO NOT change that value. The problem may not be a problem, it may be
normal operation. We don't know if he even has a faulty (probably not)
PS. If you change the value in the radio, it may not read correctly if
he connects to another supply later and may damage the radio because he
now is getting an incorrect reading.

26641. Re: Re: [FT897] batteries-12 volt, 6 cell, lead-acid vs FT-897

Yahoo group: FT897 (2009)
Date: 2009-07-02 21:09:52 UTC
From: Ron Bondy
Topic: 26460 Message: 26641

Hi Ted,

Thanks for your response.

Yes, by 'voltage regulator' I meant a 'boost regulator'.

The voltage differences are only during transmit.

Thanks for the suggestion to measure the voltage at the battery while transmitting, that shows that there is a voltage drop between the battery and the radio. The battery is about 0.6v above the radio, so there is a large voltage drop across my cable. I'm going to look into using bigger wire in the cable, and maybe solid vs stranded.

And after I checked my radio setup again I found that I didn't have things quite right.

Thanks again for your suggestions, they were a big help.

73's,

Ron

Subject: RE: Re: [FT897] batteries-12 volt, 6 cell, lead-acid vs FT-897

Hi Ron,

I'm not sure now what you mean when you use the term voltage regulator.

A voltage regulator (except for "boost regulators" - really not a regulator) run from a battery cannot put out a voltage higher than the source from the battery. Indeed, typical regulator designs require at least 1.5 volts more than the desire output, often more. The solution is to stop discharge at that point. A regulator will not help with this unless it provides a cut-off function for low input voltage (some do).

There are a couple of boost devices available that can provide voltages higher than the input with perhaps 90% efficiency. These must obviously draw more power than they put out so useable amp-hours will be reduced. The key advantage is their ability to keep the radio supply voltage at optimum levels with the tradeoff being less battery running time. MFJ has a unit and there is another but I forget the supplier name. If you google 'boost regulator' you will find them.

Further, you are correct about low voltages and battery damage - you do not want to discharge most lead acid batteries below 11.5 v.

If you see a voltage drop down to 11.6 volts I would be suspicious of the battery. Some questions to consider are:

1. At what point are you measuring voltage? If you are talking about the ft-897 screen display the voltage would be at the radio end of the supply wire.

2. Is the voltage you mention during transmit or at idle? During transmit you need to measure the voltage at the battery to know you are not simply seeing drop due to wire resistance. You can calculate the drop in the wire using ohms law. You will need to find wire resistance and current draw.

3. What voltage recovery do you see when you stop transmitting? It is normal for battery voltage to drop during high current draw but it will normally recover very quickly once the load is removed.

It sounds to me like you might have a failing battery. You might consider having it tested. At 40 watts even with 100% duty cycle (highly unlikely) the current draw will probably be around 10 amps. If you are seeing a drop of 1 volt after one half hour at 10 amps there is something wrong. Even a starting battery will perform better than that. Note that when batteries fail it is common to see drastically reduced capacity - the battery appears to charge to full voltage (12.7 ?) but cannot supply many amp hours of power.

I don't run PSK31, so my power consumption is likely around 2/3 lower per hour.

Hopes this helps a little.

Ted

Subject: Re: Re: [FT897] batteries-12 volt, 6 cell, lead-acid vs FT-897

Hi Ted,

With regard to the voltage regulator, I was thinking that the voltage regulator would be necessary when the voltage drops on transmit.

My understanding is that deep cycle batteries can be damaged if the voltage drops below 10.5v, and you don't want the voltage to drop below 11.5v to avoid excessive calcium buildup.

For psk31, I'm seeing my voltage drop to 11.6v on transmit using a fully charged 100AmpHr after say 1/2 hr of psk31 operation where I've cut back the transmit power to 40watts.

Do you run psk31 from a battery using the 897, and if so how many amp-hours of battery capacity do you use?

Thanks,

Ron

Ron,

Shouldn't be any reason for the BATTERY voltage to exceed the limit - just not possible.

However, if your charger were to put out excessive voltage it could damage the rig. It would also likely fry the battery if left high for very long.

So the control issue if the charger circuit. The charger should limit voltages to what is appropriate to the battery.

There should be no upward swing on transmit but there is likely to be a voltage drop unless you use very large, short power leads..

There are some issues with charging a bettery from a typical ham power supply that involve damage to the supply when power fails but the battery reamins connected.

One simple solution is to use a computer UPS unit to charge the battery - float voltage will be OK for many marine batteries.

Hi Bob, kc3vo,

I'm interested in learning more about batteries, and am currently setting up to also run from a deep cycle marine battery. One thing that surprises me is that you don't see much mention of using a voltage regulator. There are products out there that shut the battery off if the voltage goes outside the range 11.5 to 15v in order to protect your equipment.

Without a voltage regulator, I'm concerned that my other equipment (ie tnc) will experience voltage swings during transmit.

Is it common to use a voltage regulator when operating a ham station using batteries? Do you recommend it?

Thanks,

Ron, KD0HNE

I've had my 897 for around 6 months, and I love it. The only concern I had with this radio was the noise, which has been a topic of conversation here recently. I am in a deed restricted neighborhood, so my only HF antenna is a 19' dipole antenna in the attic. It is a small attic, and there is electric and A/C ventilation around the antenna.

On Field Day, I brought my 897 to the site, which was a horse farm out in the middle of Lake County Florida. After erecting a G5RV at about 25', I plugged my radio in and tuned it on 40 meters. The noise was almost non-existent and the signals were booming. I couldn't believe it was the same radio I brought from home. First contact was a solid 5/9. Afterwards I tuned around 20 meters and again, hardly any noise and powerful signals. After a few hours, I had to return home and plugged the radio back into the attic dipole - Noise around S9 and weak signals.

This confirmed my hope, that some of my reception issues are antenna related. I am now looking at installing a Tak-Tenna in the front courtyard. I can get it up around 25' and it still be hidden from view. I am hoping that getting an antenna outside of the attic will help my situation, and I have read wonderful reviews about the antenna.

Just wanted to share my experience with this radio. I am not dedicated to improve the antenna situation to help the radio.

Solid wire won't make any difference over stranded and will be a lot harder to 'dress' properly and is more susceptible to fatigue from repeated bending.

If you have trees in your yard, try putting a dipole strung through the tress or a long-wire. I used both with great success!

Hank,

I'm not sure if this will help, but I have a friend that although is not deed restricted, he is XYL restricted. What he did was he took dark color shielded 14GA wire, and fed it around near the top of his fence, I think he used stapled to secure it than used a caulk that is similar color to the fence (brown). To feed it he put the balun in a project box and trenched conduit to the house from the project (actually I think it was an electrical junction box) and ran his coax through that. He seems to have good results with low noise levels, but the downfall is the NVIS properties the antenna has. He is great for most of Florida, but real hit and miss outside of that. Like Dennis said if you can get a wire up in a tree that is your best bet. I have heard of magnet wire being used around the eaves of houses and other forms of clandestine set-ups. I had researched quite a few myself. I am not deed restricted, but have limited real estate to put stuff up, not to mention the way the power wires line and cross my property makes it that much more difficult.

This is one of the aspects I love about the hobby. We get a great idea, beat our heads against the wall until we figure out a solution and then commence beating the wall with our heads again until we make it work, only to be giddy when we actually get it going!!

I wish you the best of luck, and please report back here to let us know how the battle goes!! Or feel free to email me directly to let me know how it ends up.

Thanks and 73,

Adam

Two observations

You might want to look around you house for the offending noise maker.
We had HORRIBLE S7 noise at our Field Day site on a hill top far from electrical wires and the rest.
It turned out to be comming from an inverter we were using to power a laptop from a battery.
With that unconnected the noice dropped to S3 - S4.
When we diconnected the other inverters, which were reasonably clean, it dropped to S1 or less

I have a 40m Tak-Tenna
Steve (owner) is VERY helpful and wants you to be satisfied
There are some great reports on contacts made with a tak-tenna
I wonder to what extent the coax is acting as part of the antenna
If it is and power was traveling back down the outside of the shield, it would cause your radio to reduce power.
I plan on putting some torrid cores on the coax and checking to see if I can still tune the antenna
I only know enough to get into trouble, so take my comments with a grain of salt.

We used N3FJP with two FT-857s for Field Day
We used the settings noted below.
Sometimes the software would recognize the radio and work fine
Other times the software would freeze in one mode and one band.
We had it working on one radio, then unplugged the cable to test it on the
other radio/laptop.
We got it running on the second radio but when it was plugged back into the
first radio and laptop, the program froze again
After powering down and rebooting once or twice, we got it to recognize the
radio again.

Early last year for a little unofficial Field Day our club held in the part I operated from a Husky Power Center, one of those boxes with jumper cables, air pump, AC inverter, cappucino machine, etc.

I don't know what size gel cell is inside, but my FT-897 did not cut out, continued to operate as low as 11.3 v on transmit.

I have a West Mountain 4008 power strip now, and it has overvoltage and low voltage indication.

Don't use solid with for anything that you want to move around.

Hi Ron,
    Just for your info, you will have less voltage drop across stranded wire then solid. The reason is that current flows around the circumference of a wire not thru the wire in its entirety.
Fact is there will be more surface area in a piece of stranded then solid. Thought this might help you, good luck... 73' from Elkton,Md

Never took the Tech Test. Went to Extra Class

Page 4.32 in ARRL Manual says:
"As the frequency increases, the current is confined to a thinner layer of the conductor surface. This property is called skin effect." At DC there is no frequency, therefore no skin effect.
Also see: http://en.wikipedia.org/wiki/Skin_effect
The skin effect is the tendency of an alternating electric current (AC) to distribute itself within a conductor so that the current density near the surface of the conductor is greater than that at its core. That is, the electric current tends to flow at the "skin" of the conductor. The skin effect causes the effective resistance of the conductor to increase with the frequency of the current. Skin effect is due to eddy currents set up by the AC current.

Electrons are so hetro-oriented that they don't want to be anywhere near other electrons, so the push their way as far apart as they can get and ending up lining the walls of the dance hall. While they feel a strong attraction for particles of the opposite charge, they are not very picky and end up just going with the flow, bouncing from hole to hole.

Subject: [FT897] Re: batteries-12 volt, 6 cell, lead-acid vs FT-897

Never took the Tech Test. Went to Extra Class

Page 4.32 in ARRL Manual says:
"As the frequency increases, the current is confined to a thinner layer
of the conductor surface. This property is called skin effect." At DC
there is no frequency, therefore no skin effect.
Also see: http://en.wikipedia <http://en.wikipedia.org/wiki/Skin_effect>
..org/wiki/Skin_effect
The skin effect is the tendency of an alternating electric current (AC)
to distribute itself within a conductor so that the current density near
the surface of the conductor is greater than that at its core. That is,
the electric current tends to flow at the "skin" of the conductor. The
skin effect causes the effective resistance of the conductor to increase
with the frequency of the current. Skin effect is due to eddy currents
set up by the AC current.

Holes (the opposite of electrons) are also hetro-oriented. Why do they not also go to the skin of the conductor instead of the electrons? Which one gets to decide who is on the skin and who is in the center. There is also the Hole Theory which says that holes move in the opposite direction from electrons. It is called Hole Flow. This is an A.C. phenomenon.

When were you licensed? I was licensed as a novice in 1963, then General in 1964, then Advanced in a few years later then finally Extra. Where did it say in 1963 that I had to take a Tech test?
I also had to pass a code test. This is when tests were difficult and technical. Unlike today where anybody can pass the tests.

Topic: 26661 Message: 26661

If you have an accurate 13.8 volt power source connected to your FT-897,
FT-817, or FT-857 and the radio display reads a DIFFERENT voltage, it is
possible/likely that you have improperly accessed the
"SECRET/SERVICE/ALIGNMENT" menu, and corrupted its values! This menu, as stated in the
YAESU service
manual, should NOT be accessed until 13.8 volts is applied! Using a
different voltage, such as 13.0, 14.2, or 12.8 volts, is not advised! This
13.8 volts is utilized as a standard/reference for the menu settings.
Re-aligning by following the YAESU service manual correctly, will remedy the
problem. If you do not have the proper equipment and skills, contact a
qualified person, or leave it alone!-73, KC3VO, Bob Curry

Unless there have been rule changes of which I am unaware, the Tech test is required for the Extra license. You may have passed the test at the same time you passed the General and Extra tests, so you never had a Tech license.

I'm was not thinking about skin effect, which is due to eddy currents: that is limited to AC. I was thinking about Gaussian Surfaces, which apply even when there is no flow of any sort. However, it does appear that the resistance to DC current is strictly affected by cross-sectional area, and not surface area. Stranded wire gauges are set up so that a have the same cross-sectional area as a single solid wire of the same guage. I'll have to break out my physics book to see why the surface area doesn't seem matter.

Skin effect only occurs in AC circuits. In fact, if I remember correctly, House wiring and Dc wiring can carry more current on a solid wire than a stranded cable. But above 60 Hz, you definitely need stranded wire.

Either way, #10 stranded should work just fine. That's what comes with the radio. Make sure that all 4 pins on the power plug are good and keep your power lead as short as possible.

Ummm, wrong. You can go straight to general, or straight to extra.
Some people choose to do so.

There's no requirement to take the tests in successsion. If you go
straight to the Extra Class exam without holding any license,
you must take and pass the Element 2 and Element 3 written tests
(which are the same tests administered to Tech and General Glass
applicants,
respectively. So you have to pass the written tests that are given to
Tech and General Class applicants, but you can do it all in one session.

Reference:

http://www.arrl.org/arrlvec/license-requirements.html

which says in part:
" Non-licensed individuals must pass Element 2, Element 3 and Element
4 Written Exams to earn an Extra License."

Hello Dale

I had a look through the cable chart you posted the link to !

I'd just like to say that "metric" wire and cable for electrical circuits is designated NOT as "diameter",,, but as "cross section area",,, eg.
0.5
0.75
1.0
1.5 *
2.5 *
4.0 *
6.0 *
10.0
14.0
20.0
These are "square millimetre cross section"
and are the "standard sizes" for all electrical cables.
The above sizes are standard, as solid, and also as "multistrand"
The cables marked above *,, are 1.5 = household lighting ,,2.5 = power sockets, 4.0 = domestic oven [4 KW]? distance ??; 6.0 = shower (7.5KW); 10.0 = minimum size domestic main earth connection (unbroken) 14, and 16 mostly in industrial 3 phase.
funny thing in 3 phase wiring cable, 4 or 5 cores,,,P1,P2,P3, are say 2.5,,, earth and neutral are 1.5,,, strange.
cheers ____ Peter EI4HX [retired]

Skin effect only occurs in AC circuits. In fact, if I remember
correctly, House wiring and Dc wiring can carry more current on a
solid wire than a stranded cable. But above 60 Hz, you definitely need
stranded wire.

Either way, #10 stranded should work just fine. That's what comes with the radio. Make sure that all 4 pins on the power plug are good and keep your power lead as short as possible.

In long form, you said the same thing I did. EVERYONE in this hobby started out WITHOUT a license. Therefore, you HAD to take the Tech (or element 2) exam. No way around it. Now, I suppose that, depending where you go and who administers the exams, you COULD skip an exam (example: pass tech and REQUEST to take extra), however, I know of NO VE that would allow you to do so. If you pass the tech, they'll offer the next grade up. Pass the general, then they'll offer the extra.

Ummm, wrong. You can go straight to general, or straight to extra. Some people choose to do so.

There's no requirement to take the tests in successsion. If you go straight to the Extra Class exam without holding any license, you must take and pass the Element 2 and Element 3 written tests (which are the same tests administered to Tech and General Glass applicants,
respectively. So you have to pass the written tests that are given to Tech and General Class applicants, but you can do it all in one session.

Reference:

http://www.arrl. <http://www.arrl.org/arrlvec/license-requirements.html> org/arrlvec/license-requirements.html

which says in part:
" Non-licensed individuals must pass Element 2, Element 3 and Element 4 Written Exams to earn an Extra License."

My kid (he just turned 50) visited us at Easter and asked me to arrange a test session for him with my
local Ham club. I did and he passed both the Tech and General exams. His first license will be at the General level. They let him take the Extra as well but he said that one was too tough for him. Having my boy advance to my level motivated me to work on the Extra test and I managed to pass it early in June. I will have held licenses at all three stages and actually passed a code test to get my General
upgrade. I'm taking that to give me bragging points over the newest Hams.(G)

His LONGFORM reply might be in agreement with you on the testing requirements at present, but is not applicable for those of us who were licensed in 1963. So, it is important to be more specific about when the original test was administered. I looked up your call sign and I see that you are a relatively new ham, 2003 as a Technician. So, that explains why you do not understand that not all hams took the Tech exam.
When I was licensed, there was a tech exam, but it was only for people who wanted to get on VHF and there was a 5 WPM code test. If you wanted to get on HF, you tested for Novice, then General, then Advanced , then Extra. Period!

And, by the way, I have my original ARRL study guide from back then, and it did not discuss skin effect. It discussed much more technical issues such as "Draw a Pierce Oscillator" Or "Draw a Class C Amplifier", or "Draw a neutralizing circuit for an amplifier".
In today's testing, the only thing you have to draw is your name on the application form..

When I was first licensed in '66, I took my Novice and my Tech at the same sitting. There was (as you said) a 5 WPM code test for the Tech and the written exam was the same as the General, IIRC. Only difference between the two classes was the code speed and the privileges. At least that's the way I remember it, lo' these many years later.

The Tech and General written exam was the same. Only the code requirement was different .

The operating privileges were different.

If you sat for a live FCC exam and flunked the 13 wpm and passed the 5 wpm you got the tech license.

Well, it appears that you have done some research and maybe even asked a few old-timers in order to be able to send this reply, but as I said before, I was never a Tech, never tested to be a tech and never wanted to be a tech. Being a Tech was a stigma and in some circles, still is a stigma.
There was a great deal of pride in passing the exams and passing the 13 and 20 WPM code test. A pride that those who remained as Techs never enjoyed. Why, because we had to pass rigorous technical tests and the code. And we had to be a novice for 1 year before we could move up the ladder to General. This was a requirement in order for us to build proficiency in ALL aspects of the hobby. Code proficiency, courtesy, technical advancement, adhering to very limited power and band limits, etc. We had to pay our dues. It also helped to weed out the CBers from getting into the hobby unless they were really motivated.. And it gave us the privelege to work unlimited DX on HF.

That being said, the Skin Effect concept was not on my tests. And that is the original point in this conversation. If it was in the pool of test questions, I never saw it. Maybe some other applicant saw that question, but not I.
The second and most important point is that skin effect only applies to AC, not DC.

Now, since this conversation does not directly relate, any longer, to the FT897, I am ending my contributions to this thread.

Ok, you are correct that I was licensed in 2002 (actually Nov 2002). However, if you would have noticed, I currently hold a general ticket. To boot, (it is not stated), I am also a VE. Anyway, you would be correct that I have "little" knowledge of testing requirements back then. I Do know other hams that have had their ticket just as long (some longer) as you have, so I do have "some" knowledge of what it used to be like. But, I digress, that doesn't take away from the fact that you had to start "at the bottom" and work your way up. I do find it interesting that "skin effect" was not covered.

American wire gauge sizes also specify the cross-sectional area. A stranded wire that is the same gauge as a solid one will have a large outside diameter, due the the empty spaces. One should be careful using the markings on wire strippers because they generally refer to solid sizes: it's easy to nick stranded conductors with them.

Why has this thread become about battering a guy because of a minor flaw in his knowledge of historic test syllabi rather than worrying about the one who stated blatantly incorrectly that the skin effect is significant at 60Hz? It's not helping the original poster and probably giving him a bad impression of us in general.

The FT897 Group averages around 320 (+/-100 one-sigma) messages per month. Because the volume of messages is rather large, I would like to remind everyone of a few long-standing FT897 guidelines to follow. Most of you do so already.

1. Civility. (This is practiced well by our members!)

2. Please sign your messages with name and call sign, e.g., Fred - W1XYZ.

3. When replying to a posting (message), kindly delete all unnecessary text including the trailing text. Only leave the text from the prior message to which you are replying ... <snip> the rest. If one desires to read the entire thread, the command [Up Thread] at the top of the message can be used to read the entire discussion. Remember also that a lot of members have slow connections and some even pay connect time or characters rx/tx. This also helps the clarity of your message.

4. When replying to a post, please decide if your comment should be to the entire group of over 4,300 or directly to the author of the post. When you click on "Reply," it goes to everyone. To reply direct (simplex), you should click on the email address following the user ID line at the top of the post. Notice that only a part is shown for privacy. Also, please think about if what you are about to post in reply to the group really should be to the group ... replies like "I sure do agree with that" doesn't add much to the group. Send thoughts like those direct to the poster please.

5. It is fine for members to post something for sale or wanted to buy ... once per item(s). All questions and offers to buy/sell should be made directly to the poster, not to the Group. The member posting the FS or WTB may post that the item(s) was/were sold/purchased.

6. Posting of commercial items for sale by manufacturers or dealers is also fine, but should be done on an infrequent basis. The FT897 members benefit by learning of hardware, software, sales, etc. before it appears in magazines, etc.

7. New members are all moderated until their first posting. If it follows the guidelines, it is approved and the member is change to unmoderated status. This list is a partially moderated list, i.e., only first message is moderated while later messages are monitored after posting. If an unmoderated posting is found by the moderators to have a problem, then the poster is contacted directly to resolve. Actions are taken against those that chronically violate the rules.

The reason for this form of moderation is to block spammers from the list and it has been working.

8. Do not add disclaimers to your posts that (1) restrict the ability of other members to use the information you post, (2) claim a copyright to your post, or (3) to claim any type of "rights" as a consequence of another member replying to you post either directly to you or to the group.

Thanks to all es 73,
Barry - W4WB
Moderator

OK, I'm confused. This posting normally comes from the yahoo system about once a month. This post doesn't seem that way. Also, the return address is not the one usually used by Barry - W4WB, the Moderator, but it has his signature at the end. Also, the subject of the message is not the one that normally used, but another active thread.

So, is this really from Barry? Has he asked somebody to post it for him? Is somebody impersonating him? Is it supposed to be some kind of not-so-subtile hint that he isn't performing his moderation functions well? <I believe he does a very good job of it.>

If one believes that a thread should be killed by the moderator, they can send a personal email to him without posting it to this group, further adding to a thread that you believe should be killed.

By the way, if this isn't from Barry or the system, then one could view it as violating guidelines one through four.

73,
kg4jix - randy.

Which is what I did. I showed up at a hamfest last October and signed in at the front door. The guy said, "You forgot to put your call sign here," tapping on a blank on the sheet.

"Oh, that's because I don't have a call sign. I came to take the tests," I replied.

"Tests?" He picked up on that. "Which tests are you going to take."

"I intend to take all of them."

He smiled and nodded.

I did take them all, and walked out of the test room 45 minutes later having passed all three tests.

Lew is right, I did exactly that, took Elements 2, 3, and 4, but had to pass each in turn before being given the next.

OK, I didn't start from scratch, nor did I "memorize" the answers to the tests. I've been playing with soldering irons since I was a little kid. Most of it was easy, I just had to learn some rules and regs. I'll admit that I don't know diddley about tubes except that my brother has them in his guitar amp. But I've been servicing stereo gear, building my own speaker designs, hotrodding FM tuners, building antennas for AM, FM, and even WiFi, for many years.

No, I don't know CW. You guys can beat me up over that, but I have had some hams tell me, "Eliminating the code requirement is the worst thing they've ever done (yada yada yada)." Then almost in the same breath, "I used to be able to do 40 wpm. I doubt I can do 10 wpm now, I'm out of practice. I haven't done any CW in years."

So, fast fwd a few weeks, and I'm at the local ham club meeting, which was also the end of year dinner at a local greasy spoon, I mean, diner. It's time to pay the yearly dues, and for me to write a check for dues to join.

As I'm about to start writing the check I pause, look around the table and ask, "Hey, just wondering... is 'the Bandit' taken? I've always wanted that for a handle."

The club president choked, and the guy sitting across from me sprayed ice tea.

Just kidding. I promise to not say "Breaker, Breaker!" on the ham bands.

Gee, I love being a ham!

I apologize for not leaving my name and call sign. I hit the send too soon, that was my fault.
This was not meant to be an impersonation or about Barry. He runs a tight ship here!
My concern was how quickly this thred derailed. I opened a few posts in my in-box expecting info about batteries for my 897d, and I get a lecture on licences. Lets keep our eye on the prize.
I did not mean to upset or confuse anybody.

The phenomena is called skin effect. the higher the frequency the more pronounced it is.

I might add that the symbols for transistors and diodes, the arrows point in the direction of hole flow.

26687. ELECTRON FLOW ?? "OFF TOPIC"

Yahoo group: FT897 (2009)
Date: 2009-07-04 15:20:32 UTC
From: P Grant
Topic: 26687 Message: 26687

For no particular reason, not included in "the exam" ??
and NOT a discussion thread !

1) consider the movement of electrons in an electrolytic capacitor.

2) consider the burning away of the electrode in an electric arc welder

3) consider electron flow in electrolyses, using carbon rods. liberation of gasses.

4) Ditto, electroplating, using "metal" electrodes, migration of "particles"

5) Charging secondary cells.... growing crystals ...

6) Leyclanche cell,,, (primary cell)

Amazing stuff !!!

If one can observe and understand these simple phenomena, the
electron flow, in "solid state " devices is easily determined and remembered !

These items were part of my first year [Physics 1], secondary school
curriculum, @ 13 years old, and I certainly would not have understood, my
second year stuff, without this basic knowledge. (1960)
I find these a great hands on demonstration for "New Hams" in the learning the basics of
"eleck-tricks for radio"

Why has this thread become about battering a guy because of a minor flaw in
his knowledge of historic test syllabi rather than worrying about the one
who stated blatantly incorrectly that the skin effect is significant at
60Hz? It's not helping the original poster and probably giving him a bad
impression of us in general.

JJ

The first to respond to a question are those who know the least about it and do not understand the technology.

They just heard it some place and it may not be correct .

Most do not have any formal electronics schooling and do not understand theory of anything.

They just repeat what they have heard with out thinking about it.

This is true on most lists I am on.

I read them mostly for entertainment . .

There are a lot more list more entertaining than this one .

Dale

26689. ameritron amp

Yahoo group: FT897 (2009)
Date: 2009-07-04 20:24:11 UTC
From: Thomas Meggison
Topic: 26689 Message: 26689

Good evening all, I just acquired an AMERITRON AL-80B AMPLIFIER & a Palstar AT1500DT antenna tuner. Now being a fairly new ham, and this being my first amplifier I would like to know what cables are needed to connect the FT 897D to the Ameritron Amp. I know I need coax, but is there special cables needed and where can I get them. Learning to tune the amp and the antenna tuner is next after I hook everything up. But first I need to hook it up. Any help would be greatly appreciated.

HI Ron,

That does not apply to DC, only AC and specifically more so as the frequency increases.

At DC you need the lowest possible resistance and therefore the greatest cross section area. Only reason to use stranded over solid conductors at DC is for flexibility.

Hi Ron,
    Just for your info, you will have less voltage drop across stranded wire then solid. The reason is that current flows around the circumference of a wire not thru the wire in its entirety.
Fact is there will be more surface area in a piece of stranded then solid.
Thought this might help you, good luck... 73' from Elkton,Md

Early last year for a little unofficial Field Day our club held in the part
I operated from a Husky Power Center, one of those boxes with jumper cables,
air pump, AC inverter, cappucino machine, etc.

I don't know what size gel cell is inside, but my FT-897 did not cut out,
continued to operate as low as 11.3 v on transmit.

I have a West Mountain 4008 power strip now, and it has overvoltage and low
voltage indication.

From: Michael Walker (VA3MW)
Topic: 26689 Message: 26691

Wow, this question is asked on just about every forum every week. This is one of those times that Google is your friend.

Since an AMP is a non-trival piece of equipment, you need to take the time to understand the keying, grounding, power and possibly ALC.

Lots of info here:
http://www.dxzone.com/catalog/Technical_Reference/Amplifiers/HF_Amplifiers/.

However, assuming you have good grounds, good power, you only need 1 wire to make it work, and that is the PTT lead. It is clearly outlined in the manual.

RFI or RF Feedback will be your biggest problem. Likely 40M will be worst for you. A 2000W dummy load is good to practice on.

I had questions about my amp. I contacted Ameritron and they helped. Try that, you will get the correct answers and quicker.

You can buy the part and replace yourself, as long as you are good at soldering small parts. As for your knob, I guess you didn't realize the rubber ring comes off and there is a set screw underneath that you tighten to keep the knob in place. This is because there is a spring under the knob that you can use to tighten/loosen the "spin" on the knob! OMG - I cannot believe you GLUED it on!!!

The reason I glued it was that the plastic part under the spring broke off into two pieces. after the radio fell on the floor landing right on the tuning knob.

Hi Lew and Group,

I have a question. If I have to 55AH batteries connected together would that be enought to feed the FT-897D? Also I am scaling back my go kit idea. What does everyone think of this.

```
FT-897D                                HF/VHF
FT-100                                   Red Cross (If needed)***
FT-7800R                              APRS/Packet
FT-8800R                              UHF, Crossband
VX-8R   (3)                            spares
VX-7R***
Kam-XL                                 HF/VHF TNC
```

Antennas:

```
 RADS 9-11/A1                     HF/VHF/UHF
RADS 9-11/A2-VU  (3)         VHF/UHF
```

Coax:

```
 4  50ft. rolls  LMR-400UFN with connectors on
```

Misc.

connectors, flashlight, spare batteries,

Clothes:

Worst case at least one week

From: Lew Phelps K6LMP <k6lmp@...>
To: FT897@yahoogroups.com
Sent: Wednesday, June 17, 2009 9:49:18 AM
Subject: Re: [FT897] batteries

Assuming worst case, which is transmitting at 100 watts output, and assuming that you could drain the battery to 90% before its output voltage drops to the point that the transmitter will go on strike, you could transmit continuously using this battery for approximately 4 hours.

If you make more realistic assumptions, such as 50 watt transmit power and 10% transmit duty cycle, and using squelch to reduce current drain when in receive mode, you're looking at much better numbers: current drain in squelch mode is 0.6 amp; in receive mode is 1 amp; in transmit mode will be about 12.5 amps. Let's assume that in receive

you're in squelch mode half the time, so your average current draw when not transmitting is 0.8 amp. If you are in receive only mode, you could operate for 90 ÷ 0.8 = 112.5 hours.

Every minute you transmit at 50 watts draws 15 times as much current as when receiving. (If you transmit SSB, the current draw will be 1/2 to 1/3 what you would use on FM or AM).

If you transmit for one hour at 50 watts FM, you consume 12.5 amperes, and thus 12.5 ampere hours, That leaves 99-12.5) ÷ 0.8 = 96.875 hours receive time.

So, to generalize as a rule of thumb, your 100 ampere hour candidate battery would allow you to operate for about 100 hours. You can scale that up or down; assume about 1 ampere hour battery capacity will give you about 1 hour of operating time at 50 watts and using squelch. You can extend the time somewhat by lowering transmit power, and by operating in SSB mode, and if you turn off squelch, which you would most likely do on HF bands using SSB, you would draw more current in receive mode.

This battery should serve you well for off-grid applications. For its amp-hour capacity, it's relatively small and light; the AGM construction means you can tip it over without spilling battery acid. It should recharge quickly. There are other deep-cycle AGM batteries on the market that I would also consider if I were buying a battery right now. For one, the Optima Yellow Top D31, which has about 75 ampere hour capacity but costs less. The Optima batteries are sold by Interstate Battery dealers, and also at Sears, and at many stores that cater to off-roaders, who are fanatic fans of Yellow Top batteries for winches. If size, weight and cost are not issues, you might want to look at the Odyssey PC1800-FT, which weighs 130 pounds but packs 214 amp hours. Also AGM spiral wound, like the Optima. It has an unusual form factor -- 22 x 12 x 5 inches -- which might be desirable and might not, depending on your intended use. See http://www.odysseybattery.com/ .

Darren,

Firmware updates for the FT-897 requires the rig to be sent to Yaesu for EPROM reprogramming. As far as I know the only firmware update Yaesu has done for the FT-897 series involved the use of the MH-59A8J remote microphone, & that was just before the FT-897D came to market.

Mark (NM7L)

26701. Re: ft-897 firmware. Is it updateable

Yahoo group: FT897 (2009)

From: Robert G. Schaffrath
Topic: 26698 Message: 26701

The lack of field updating is one thing turned me off on the FT-897D even though I did buy one. At times there are changes, such as the MH-59A8J support mentioned below, that require an update (the radio is basically a computer after all). The need to send it back to the manufacturer for an update is a real drawback. Should the 60m band channels change at some point (there is an ARRL petition to change one of the frequencies), the current firmware will need to be update to reflect the change OR the radio will have to be modded to open its transmit range up. It would have been nice to be able to go to the Yaesu web site, download a firmware update and load it into the radio.

Firmware updating will definitely be a feature I am looking for the next time I purchase a radio.

From: Bill Barbee
Topic: 2567 Message: 26702

I own an FT-897D and a couple of FT-840 radios. I sent one of the FT-840's to Yaesu in California for service on the 26th of June by USPS. I just received
the repaired radio by UPS at 12:30 PM Central time. 10 day turn around !!!
Not too shabby Yaesu.

I have a FT897 (non-D) and was wondering if I have to send it to Yaesu to have the 60 Meter band opened up for transmit or is there another way to do that?

Subject: [FT897] Re: ft-897 firmware. Is it updateable

The lack of field updating is one thing turned me off on the FT-897D even though I did buy one. At times there are changes, such as the MH-59A8J support mentioned below, that require an update (the radio is basically a computer after all). The need to send it back to the manufacturer for an update is a real drawback. Should the 60m band channels change at some point (there is an ARRL petition to change one of the frequencies) , the current firmware will need to be update to reflect the change OR the radio will have to be modded to open its transmit range up. It would have been nice to be able to go to the Yaesu web site, download a firmware update and load it into the radio.

Firmware updating will definitely be a feature I am looking for the next time I purchase a radio.

There is a DOS program floating around that can supposedly do this on the non D models, but you have to have a physical serial port (not a USB converter) on COM1 for this to work. All the program does is send a CAT command, which you can also do via HAM Radio Deluxe. Note, this does not work on the FT-897D.

I would suggest using HRD's custom CAT command screen to try sending 00 04 00 00 BB first and see what result you get. WRITE THIS DOWN.
Then try sending the write command: 00 04 00 00 BC. Then you have to power-cycle the radio. If that works, you should have all tx frequencies open.

If the write is successful, you should get a response of 0. If you get any other response, the radio is probably blocking the write request (meaning you have to open the radio and do the jumper modification instead.)

If it doesn't work, you can try some other values:
00 04 *37 06* BC opens up receive on the Japanese model

Here's how it breaks down:
bytes 1-2: Address
bytes 3-4: Value
byte 5: BC-Write to memory. BB - READ from memory

For example,
00 04 *12 34* BC would write the value "1234" to memory location 0004.
00 08 00 00 BB reads memory location 0008

If some other folks (with an opened up TX) can report back what their radio shows when they run the READ command (00 04 00 00 BB), maybe Danny can try one of those settings.

From what I've read, entering an invalid value should not damage the radio (you can just write back your original setting.), but all the usual disclaimers apply: your risk, your responsibility.

You can also look at the extended TX mod:

Topic: 26460 Message: 26706

Dan,

I am not sure if this was intended as a serious question (hetro-oriented???), but I'll answer it anyway.

Holes and hole current are only found in semiconductors, such as silicon. So they do not exist in conductors or insulators.

Holes are actually locations in the crystal lattice of a semiconductor that are short one electron.

Finally, hole current is not exclusively AC.

Rob

Please point me to a piece of reference material which excludes evrything (including copper) except semiconductors. It seems to me that when an electron leaves it's orbit, it leaves a hole behind, regardless of the material, no matter the material. I am open to being educated here.

And yes I know that hole current is not exclusively AC. As the electron moves east, the hole moves west, or perhaps the hole remains in place waiting for a new electron. But the hole at least appears to move in the opposite direction.

Dan,

Since this is part of my area of expertise, and this is a pretty basic question, I consider myself to be one reference.

Just for you, I did some quick research. The IEEE Dictionary defines hole as: "A mobile vacancy in the electronic valence structure of a semiconductor that acts like a positive electron charge with a positive mass."

The valence structure of a metal is quite different from doped silicon, so there are no holes in conductors.

Unfortunately, a good explanation is not short, so I would suggest further research if you are interested.

There are a number of textbooks on the subject. A search of Amazon would give you a number of choices. Search for "semiconductor physics".

In a semiconductor, in the presence of an electric field, the holes and electrons do move in opposite directions. Since the charges are opposite the "conventional current" moves in the direction of the holes and includes both the hole and electron current contributions.

Guys!

This is so freaking far OT that it should have its own zip code! Just drop it already. I'm about 2 posts away from dropping this mailing list in my spam folder.

This is a little off topic for this thread.

From: af6cm_yahoo@... [mailto:af6cm_yahoo@...]
Sent: Monday, July 06, 2009 6:45 PM
To: Yahoo FT897 Group
Subject: [FT897] Hole Current (was Re: batteries-12 volt, 6 cell, lead-acid vs FT-897)

Dan,

I am not sure if this was intended as a serious question (hetro-oriented???), but I'll answer it anyway.

Holes and hole current are only found in semiconductors, such as silicon. So they do not exist in conductors or insulators.

Holes are actually locations in the crystal lattice of a semiconductor that are short one electron.

Finally, hole current is not exclusively AC.

Holes (the opposite of electrons) are also hetro-oriented. Why do they not also go to the skin of the conductor instead of the electrons? Which one gets to decide who is on the skin and who is in the center. There is also the Hole Theory which says that holes move in the opposite direction from electrons. It is called Hole Flow. This is an A.C. phenomenon.

26713. Circuit question - repeater controller

Yahoo group: FT897 (2009)
Date: 2009-07-07 16:39:33 UTC
From: Thomas Wilson
Topic: 26713 Message: 26713

Hi, guys.

I'm hoping someone can help me design a circuit to run a small cross-band repeater at my house. Here's the general description:

I have an older Yaesu 220 MHz transceiver. It's a bare-bones radio with no VOX and no data port. So I will have to use the 6-pin modular mic port for input. I can get output from the speaker jack.
I have an FT-897 and a breakout cable going to the data connector on the back.

I want to build a bi-directional cross-band repeater that will send the 897's received audio through the 220 radio and transmit audio from the 220 side back to the 897. I want to use this with my HT in much the same manner you'd cross-band with something like an FT-8800.

I've already build a data cable for the 897, and using digital VOX, I can make the 897 transmit audio received by the 220 radio... what I'm working on is going the other way. The 897's data port has a pin that puts out around 4.2 volts when the 897's squelch is open. However, the pin can't provide enough current to close a relay. When I tried, it actually CLOSED the squelch. So I figure I need a transistor (and a small amount of power) to actuate a relay to close the PTT circuit on the other radio. I want to use a relay to keep the radios separated. I'm using isolating transformers on the audio lines for the same reason.

Does anybody have any ideas for a high impedence circuit, activated by the data port's squelch line, that can close a relay for the PTT on the other radio? I figure that I'll need a power supply, transistor,
diode (for power protection), and a small relay.

I understand what each part does and general electronics theory, but I don't know enough to design a circuit (specifically, what transistor to pick, and whether I'll need other parts around it to protect it.)

Tom,

I would suggest using a MOSFET as your transistor. It does not draw any appreciable current on its input (gate). You are on the right track. You may / may not want to add a resistor to limit the current.

You listed the high voltage (VIH) of 4.2V. What is the low voltage (VIL)? Is it 0V?

Feel free to email me direct, if this is "off topic".

Thanks Tom. I will get a CAT cable and download HRD and see if I can get to work.

You can also look at the extended TX mod:

http://www.ham. dmz.ro/yaesu/ ft-897-extended- transmitrange. php

Correct.

When there's no signal, the line is at 0v.

When there's a signal (and I should be keying the link radio), the line is
4.2v.

From: af6cm_yahoo@myfastmail.com
Topic: 26713 Message: 26717

Good. An enhancement NMOS FET should work nicely to drive
a relay and not load the radio output.

The circuit would look like this:

Connect the source (S) of the FET to ground. The gate (G) goes
to your input signal. The drain (D) goes to the relay coil.
The other end of the relay coil goes to positive supply voltage.
Add the bypass diode, as you already know.

I would select the relay first. If you get a 5V relay, for
example, you don't need a current limiting resistor for a
5V supply. You need to select a FET that can sink enough
current to drive the relay coil. What is the coil resistance?
Add this to the RDS of the transistor. I = V / R gives you
the total current. (Make the V somewhat larger than you expect.)
Do not exceed Id Max (or IDS max) for the FET. Do not exceed
the power number (I * I * RDS) for the FET either.

I think you will find that nearly any power N-channel MOSFET
will work for this application. Choose a package that is
easy to work with.

Use anti-static precautions when handling the FET.

Sounds like a fun project!!

Thanks, Rob.

I pulled out my Electronics Experimenter's kit, and it has a circuit
almost identical to what you described.

I'm going to need to order some parts from Jameco, it looks like.

the programme you are referring to is called "Softjump"

From: Thomas Wilson <wilsontp@...>

Subject: Re: [FT897] Re: ft-897 firmware. Is it updateable

There is a DOS program floating around that can supposedly do this on the non D models, but you have to have a physical serial port (not a USB converter) on COM1 for this to work. All the program does is send a CAT command, which you can also do via HAM Radio Deluxe. Note, this does not work on the FT-897D.

I would suggest using HRD's custom CAT command screen to try sending 00 04 00 00 BB first and see what result you get. WRITE THIS DOWN.
Then try sending the write command: 00 04 00 00 BC. Then you have to power-cycle the radio. If that works, you should have all tx frequencies open.

If the write is successful, you should get a response of 0. If you get any other response, the radio is probably blocking the write request (meaning you have to open the radio and do the jumper modification instead.)

If it doesn't work, you can try some other values:
00 04 *37 06* BC opens up receive on the Japanese model

Here's how it breaks down:
bytes 1-2: Address
bytes 3-4: Value
byte 5: BC-Write to memory. BB - READ from memory

For example,
00 04 *12 34* BC would write the value "1234" to memory location 0004.
00 08 00 00 BB reads memory location 0008

If some other folks (with an opened up TX) can report back what their radio shows when they run the READ command (00 04 00 00 BB), maybe Danny can try one of those settings.

From what I've read, entering an invalid value should not damage the radio (you can just write back your original setting.), but all the usual disclaimers apply: your risk, your responsibility.

What about the repeater offsets??? When you do the hard mod, you loose them. Will this help??? My 897 (non D)had the mod done when I bought it used. If the repeater offsets can be restored, I will un-do the mod and do it this way.

When the radio first boots up (after a reset), it reads the hardware jumpers
in to a memory location.

What the SOFT mod does is overwrite those jumper values with the values that
would be there if you'd changed the jumpers.

So the short version is: hard or soft, you will get the same results with
the same jumper settings.

26723. Positioning of 204 foot doublet help required

Yahoo group: FT897 (2009)
Date: 2009-07-01 22:09:09 UTC
From: simon.worsley
Topic: 26723 Message: 26723

Gents and Ladies,

First, a great shake of hands to Tim in VK land for all your help on my previous posting ! Your a gentleman and a Sholar as we say over here in Blighty (london!)

Ok, I have installed a 204 foot doublet which seems to work well on all bands.

Our front garden is 20 feet long

Then the house which is 40 foot long (with a side path right from the front to back garden which the wire goes over) and the main mast which is 40 feet high is on the side of the house at the back. (60 feet from the very front garden to this mast)

Then the back garden is 100 foot long so in total length I have 160 foot to install the doublet so need to bend it in to fit my land.

Please note, the main mast which is 60 feet distance from the front of the property and the highest point on the mast is 40 foot above ground (unfortunately, the back garden slopes upwards away from the house about ten feet higher at the end of the garden, ten feet higher than the house ground level where the 40 foot mast is)

Currently I have the 204 foot doublet set up so one end is right at the front of the property at 15 foot off the ground, then 60 foot of wire goes to the top of the 40 foot mast, then it falls to the back corner mast which is about 20 foot off the ground and then the wire goes at a right angle for ten feet, and then back on itself for about 20 feet at 10 feet high.

Like I mentioned, this seems to work well - but of course I want to get it in its best position as possible and cant raise the height any further than the existing mast measurements noted above.

Due to the mast being 60 foot from the front of the property, the mast which is obviously the highest point of the antenna is not at the centre of the antenna. Where the centre of the antenna is about 25 foot high from ground due to the slope on the wire to where it is anchored at the back garden and the rising back garden.

So my question is where would the best optimum situation for the wire?

Will it make much difference if I change it from where it is now? Is there a better optimum?

Does it matter too much that the highest part of the antenna is NOT where the feed is? I could pull the antenna back towards the house so the feed is the highest point, but then would have excess wire at the front of the house to deal with.

All help much appreciated !

Best Regards and 73 from London

Simon, G7IVJ

Spec of wire antenna:

Van Gorden - G5-RVM HF wire antenna
Length - 204ft
Bands - 1.8 - 30 Mhz (160-10m)
Power handling - up to 2Kw
Feedline - 450 Ohm ladderline cable

I am preparing info on a loaded 897D for posting on the various FOR SALE boards. As I have seen in the past, I am making a quick notation here in case anyone wishes to contact me off list. It is an 897D with two Collins mechanical filters, and includes the Yaesu tuner, fancy DTMF microphone, built in AC supply and the entire built in Yaesu battery assembly with Yaesu charging adaptors. I would like $875.

26728. Positioning of 204 foot doublet in 140 foot x 20 foot piece of land !!

Yahoo group: FT897 (2009)
Date: 2009-07-02 21:43:09 UTC
From: simon.worsley
Topic: 26728 Message: 26728

Gents:

I have two confessions:

We have just re-measured the plot of land and it is diferrent to what I wrote. I also just measured the 204 foot doublet as it is installed, and it is alo diferrent to what I previously wrote. Sorry !

Here are the true dimensions:

Plot of land:

140 foot long
20 foot wide

Tree in front garden wire installed at ten feet high sloping sharply up to:

Mast on side of house at 37 feet above ground level and 40 feet distance back from Tree in front garden

100 feet distance from the mast on the house to the mast at end of back garden. Wire installed at 15 feet above ground level on the back mast in the back left hand corner of garden (note the wire is diagonal over the plot as the mast is on the right of the house and mast at end of garden is on left hand corner)

Close to this mast, the wire then makes a right angle turn for 14 feet to a tree on the opposite right hand side of the garden, and then the wire makes another right angle turn TOWARDS the mast on the side of the house for 44 feet and at the end the wire is just 4 foot off the ground.

Note the centre of the doublet where it is fed, is about 15 to 20 feet directly ABOVE where one end of the wire terminates 4 foot above the ground.

My findings operating this antenna situated as above, seems to be ok on 160 metres on both TX and RX, 80 metres seems fine on both TX and RX

40m I seem to be able to hear many more stations than I can work and same on 20metres, can hear many stations but only work approx half.

Havent tried 10m yet.

All help much appreciated.

The best idea would be to have the main mast at 70 feet in the middle of the plot, but as it is attached to the house that is not possible.

When I add up the measured length of the antenna when it is situated as above the length totals 188 foot, in other words
48 foot too long for my plot. I could of course shift the antenna and have a spare 24 feet

at each end and bend it around a bit, but this doesnt bypass the problem of the main mast being just 40 feet from the front

73 Simon G7IVJ

I have an FT-897 not D verision for sale.

I also will include:

2 internal batteries
LDG Tuner AT-897 Attached to unit
CD-24 Charger
PA-26 AC-Charger
Original Manual

I'd hope to get $750 for the radio plus the accessories. But will negotiate.

I bought this unit on Ebay a few months ago and has worked great. However, I need something for backpacking. So I am looking to purchase an FT-817.

Would be willing to trade.

Thought I would offer it to the group before I put it out on Ebay.

Please contact me directly at KC0YDW@...
Kilo Charlie Zero Yankee Delta Whiskey [at] gmail.com

Thanks!

Casey

26730. No voltage on CAT/Linear jack

Yahoo group: FT897 (2009)
Date: 2009-07-04 00:36:53 UTC
From: wschweinberg
Topic: 26730 Message: 26730

I inserted a jumper to pin 2 (+13.5 volts) and pin 5 (gnd) and measured it with a multimeter set to DC voltage. It did not give me 13 volts. In fact, it didn't appear there was any voltage. I was to use the CAT/Linear jack to connect the LDG AT897 Tuner. It gets its power from the CAT/Linear jack per LDG tech. When I push the button to tune, nothing happens. He thinks it's notgetting power. I agreed, especially now after I measured it with a mutimeter.

Has anyone had a problem with the CAT/Linear jack not provided the voltage? Is there a fuse somewhere I can replace? Is there a way to fix this?

I don't know what else it could be other than a bad CAT/Linear jack

26731. Dangerous problem??

Hello all,

I made an experimental 50 MHz antenna according to instructions by Brian G0IER. (http://www.qsl.net/g3pto/6m_dipole.html)

Something apparently went wrong. When I tested transmission with 5 watt minimum power and keyed the cw key for a second, the rig FT-897 went off and completely blank for a second. The lights off etc. Using FP-30 power supply. I thought something catastrophic happened but when testing on another band I found the rig is working still at least for the time being normally.

Wondering if that is a normal reaction when e.g. there is a short circuit in antenna or something similar. Has anybody experienced the same. Could I have damaged something in 50 MHz band? I do not have another antenna for that band and I did not dare to test the same antenna agin.

Ben

From: ve2cu
Topic: 26733 Message: 26733

Hello everyone,
Got a brand new 897D & purchased an MFJ-929 Auto tuner, as well as the MFJ-5114Y, proper Yaesu Interface cable. As per MFJ, the tuner is supposed to be powered by the FT-897 CAT jack. Power required is 12-15V @ 850ma. Once I trimmed the cable plug to properly fit in the CAT/Linear jack, plugged it in but can't power up the tuner. Yet, using an outboard 12V power supply, the tuner works perfectly. I wonder if anyone has had this problem & if so, could it simply be a bad cable or what? Please bear in mind I have no way to check voltage/current on the CAT plug. Your assistance will be deeply appreciated. Thanks in advance & kind 73, Michel VE2CU

26734. Voltage display still a mystery

Yahoo group: FT897 (2009)

From: adeymcuk
Topic: 26734 Message: 26734

Well I never really got to the bottom of my low voltage display on the 897, I tested the PSU with a Voltmeter on full Tx I get only a very small drop, less than half a volt which seems fine to me, so If I TX at full power FM the PSU from idling at 13.8 may drop to 13.5ish but the display on the 897 shows around 12.5, so PSU tests fine, Ive tried 3 different Power cables to the 897 all exhibit the same problem, on RX the 897 shows 13.8 fine and in TX it drops about 1 Volt, the radio behaves perfectly, I get full output, it works as it should with no other issues appart from the Voltage on TX does not display correctly, not sure where to go with this one as all appears fine, its more an annoyance factor

26736. Is the FT897 subsceptable to reverse voltage polairty like the FT817?

Yahoo group: FT897 (2009)
Date: 2009-07-06 13:23:44 UTC
From: dxh
Topic: 26736 Message: 26736

I have an FT817, and they are notorious for the finals being blown by connecting power in reverse polarity or due to over voltage spikes because the finals are actually still connected to the DC Input even when the radio is off.

I even built one of the power protection kits for my FT817.
http://www.wulfden.org/TheShoppe/ft817/index.shtml

I recently purchased a FT897 as well, and I was wondering if anyone knows if the radio has the same issues.

Is there good protection against reverse polarity and/or over voltage in the 897? Or should I build something similar to provide some power input protections for my FT897D as well?

> I've not seen it before, but could it be a spurious/parasitic oscilation? Poor contact somewhere in the new ground path causing capacitance?
>
> - Richard

Hi Richard, all,

I checked for spurs by running the rig into a dummy load via a directional coupler, then looking at the carrier on a spec-an up to 1GHz, nothing but the usual main carrier + large lump of noise floor either side of it. I checked the tightness of the screws around the RF/PA PCB and they were reasonably tight. The odd thing about this particular fault is that it happened whilst the rig was running low power (5w) on 144MHz into a dummy load. I'm at a loss as to what caused this fault. The current fix is a small piece of kapton tape on the underside of the RF/PA metal cover that prevents the grounding strip from touching the ground of the metal cover... all very odd.

Any pointers gratefully received.

thanks and regards,

Paul M0EYT.

This failure is an old hut. In series with the dot- and dash-lines are two easyly burned 1/16Watt (!) 1kiloohm resistors. (Pos. R1565 and R1566). In case of failure change them to somewhat larger SMD 0805 chip resistors. Solder the new 1KOhms over the old ones. Add a 10nanofarad ceramic kondenser from the keyjack inputpins to ground. Add a choke in the keyer cable as recommended.
Hopefully the keyer input will now withstand its own power! Take the 100 USD and have a cool beer together with the lucky solderer (soldier hi).73 es 55 de Lup DJ7SW

As many of you may be aware, the CW keying circuits of the FT-897 and FT-897D are easily damaged by strong RF fields as exist when operating near a portable antenna. For those not familiar with the problem, a search of the FT-897 Newsgroup archives will reveal that multiple owners have had to return the radio to Yaesu for a $100.00 repair after operating in strong RF fields. On two separate Field Day outings my FT-897 experienced this failure. After the second failure I upgraded to an FT-897D. Thinking that the problem had probably been addressed in this model, I once again went to Field Day ... and killed the keying circuit. This made three times! In the first case, I was using a Maldol (20m) whip mounted directly to the coax connector on the radio rear-panel. In the other two cases, I was operating at a transmission line length of 25 feet from a Buddipole dipole approximately 15 feet above ground. The distance from the radio to the
nearest point of the radiating element (depending on dipole orientation) was probably between 5 and 20 feet. Following the third trip back to Yaesu, the technician sent a ferrite choke to be placed on the keying lead at the male plug. But he suggested (tongue-in-cheek) that the only way to be SURE the problem wouldn't recur was to stop operating CW!

Anyway, what prompted this posting is that I HAVE JUST FINISHED FIELD DAY 2009 WITHOUT MISADVENTURE! !! I was using the Buddipole up 15 feet with its 25-foot long transmission line as I had in the previous two failures. But I ADDED 50 ADDITIONAL FEET of transmission line to get me 50 feet further away from the radiator. (I used the ferrite choke as well). Operation was on both 40m and 20m. I'm sure that people differ in their opinions as to what constitutes a successful Field Day. But for me, it was a day of fun operating CW outdoors making essentially effortless contacts and NOT ENDING WITH A FRIED RADIO.

In conclusion, if operating CW with the FT-897(D) - stay away from the antenna.

Subject: Re: [FT897] batteries

Assuming worst case, which is transmitting at 100 watts output, and assuming that you could drain the battery to 90% before its output voltage drops to the point that the transmitter will go on strike, you could transmit continuously using this battery for approximately 4 hours.

If you make more realistic assumptions, such as 50 watt transmit power and 10% transmit duty cycle, and using squelch to reduce current drain when in receive mode, you're looking at much better numbers: current drain in squelch mode is 0.6 amp; in receive mode is 1 amp; in transmit mode will be about 12.5 amps. Let's assume that in receive you're in squelch mode half the time, so your average current draw when not transmitting is 0.8 amp. If you are in receive only mode, you could operate for 90 ÷ 0.8 = 112.5 hours.

Every minute you transmit at 50 watts draws 15 times as much current as when receiving. (If you transmit SSB, the current draw will be 1/2 to 1/3 what you would use on FM or AM).

If you transmit for one hour at 50 watts FM, you consume 12.5 amperes, and thus 12.5 ampere hours, That leaves 99-12.5) ÷ 0.8 = 96.875 hours receive time.

So, to generalize as a rule of thumb, your 100 ampere hour candidate battery would allow you to operate for about 100 hours. You can scale that up or down; assume about 1 ampere hour battery capacity will give you about 1 hour of operating time at 50 watts and using squelch. You can extend the time somewhat by lowering transmit power, and by operating in SSB mode, and if you turn off squelch, which you would most likely do on HF bands using SSB, you would draw more current in receive mode.

This battery should serve you well for off-grid applications. For its amp-hour capacity, it's relatively small and light; the AGM construction means you can tip it over without spilling battery acid. It should recharge quickly. There are other deep-cycle AGM batteries on the market that I would also consider if I were buying a battery right now. For one, the Optima Yellow Top D31, which has about 75 ampere hour capacity but costs less. The Optima batteries are sold by Interstate Battery dealers, and also at Sears, and at many stores that cater to off-roaders, who are fanatic fans of Yellow Top batteries for winches. If size, weight and cost are not issues, you might want to look at the Odyssey PC1800-FT, which weighs 130 pounds but packs 214 amp hours. Also AGM spiral wound, like the Optima. It has an unusual form factor -- 22 x 12 x 5 inches -- which might be desirable and might not, depending on your intended use. See http://www.odysseyb attery.com/ .

26746. Does FT-897D have same danger issues with polarity and over voltage as FT-817?

Yahoo group: FT897 (2009)
Date: 2009-07-05 03:02:58 UTC
From: dxh
Topic: 26746 Message: 26746

I have an FT-817, and they have a notorious danger with having zero protections in the design for reverse polarity or over voltage.

I went so far as to purchase the kit and build an add-on voltage polarity/over protection mod for my FT-817. Avail here: http://www.wulfden.org/TheShoppe/ft817/index.shtml

I just purchased a FT-897D and was wondering if they have the same issues and will be as likely to blow as the FT-817 was. If so, maybe I will build another version of this power protection kit for the 897D.

Thx

26747. Tuning Issue

26748. No cw transmit

Yahoo group: FT897 (2009)
Date: 2009-07-04 15:55:57 UTC
From: kmiller8
Topic: 26748 Message: 26748

The FT-897D is my portable radio. I use it a few times per year. I seldom work phone, mostly cw. Today I finished setting up the radio out by the lawn chair. Plugged in the key and set the LDG tuner on 20 meters. Transmitted on cw for a few seconds then nothing. Full output on ssb. Full cw output and keying fine with MICKEY feature. But no keying therefore no output with keyer paddle or straight key plugged into rear panel key jack. I have [BK] and [KEYER] set as required. I have the key plugged into the proper jack. But no cw keying. It almost seems like the rear panel cw key jack is disconnected but it would be unlikely for all connections from it to fail at the same time. Did I select some "feature" in error that I am not aware of?
It makes no difference if I select [MICKEY] or [ELEKEY], microphone keys the radio and transmits fine, cw jack does not. I could find no reference anywhere on the web of anyone else having this happen. Any suggestions?

Hi Lew, I spoke to a Yaesu spokesperson on their stand at Dayton last month describing the problems I have had with my Atas 25 and also using extra earth wires to hopefully help but the SWR was always too high after I moved my hand away from the tuning coil. I explained my fellow radio club members could not recommend an Atas 25 after we all had a go testing it, he replied he couldn`t recommend it either !! So that was a waste of $230+ Best of luck with the replacement and all the best.

26751. Re: FT-897D Cracklin Receive Audio on FM

Yahoo group: FT897 (2009)
Date: 2009-07-02 17:42:07 UTC
From: Raymond Johnson
Topic: 26565 Message: 26751

Paul,

My FT-897D has developed the exact same problem. It is definately internal to the radio. Mine started out of no where, a couple of Sundays ago. I had set everything up to do our regular net, talked to a couple of people and shut down. When I started the net the crackle on everyones signal was so bad I could not copy anyone. My transmit signal was reported to me as perfect.

Troubleshooting so far:

1. Attached antenna dummy load crackle still there. NOTE: I had my FT-990 right next to the FT-897 no noise heard on the 990.

2. Changed power supplies - no help.

3. Checked power supplies with scope - clean power.

4. Moved power supply off of APC - UPS to line power - no change.

5. Checked AC with scope - clean.

As you mentioned it is worst on AM but present on all modes & all bands to varying degrees.

I am hoping to open it up this weekend and "poke around". Fortunately I am blessed to have an IFR-1600 Communications Monitor and a good HP Digital Scope.

I will let you know what I find. If you run accross anything I would appreciate you letting me know. The best email for me is: w7rkj@... <mailto:w7rkj@...> . If you respond to Yahoo it might take me an eternity to dig your message out of the SPAM.

73,

Raymond - W7RKJ

I am using the FT-897D with the LDG-897. I would like to combine this with a Signalink USB to do PSK-31, etc. The software I would like to use is Ham Radio Deluxe with Digital Master 780. Is anyone using this combination? How does it work? Any tips for a new user? Thank you.

26755. Accessing the features

Topic: 26755 Message: 26755

Hello Group,
I am a newcomer here and have had my 897 a couple of months. I am still in the learning mode. While looking over the many features, I happen to notice when I scanning through the menu, the word "skip" is present on the lower left side of the display. What does this mean? Also, I have had problems programing tone on the 2 meter band. I have followed the instructions to the best of my knowledge. I know it's some little thing that I am not doing correctly, but it's about to drive me nuts. The first frequence will work, but when I program the tone into the next frequency, the toneis set for that frequency but changes the first tone setting to the current one.
Thanks in advance for your help.

From: Raymond Johnson
Topic: 26565 Message: 26756

Paul,

I have the exact same problem and my radio is about the same age as yours. It showed up about 3 weeks ago. I normally do our clubs Sunday evening net. I downloaded ARRL audio news, had someone do a level check and shut everything down. I fired everything up and started the net (about 2 hours later). Everyone said my transmit audio was fine but I could not understand anyone because of the noise, just as you describe it, like lightning crashes.

Since then I have:

1. Changed power supplies
2. Put a scope on my incomming power (clean)
3. Reset the radio to factory defaults.
4. Placed a dummy load on the antenna and tuned through the bands (noise is all over) I had my FT-990 next to the 897 and heard no problems on the 990.

So it is definately internal to the radio!

Now I am trying to find time to put it on the bench or take it to repair (and pay through the nose).

73,
Raymond - W7RKJ

26757. Re: [FT897] No voltage on CAT/Linear jack

This is a relatively common problem. There's a Zero Ohm resistor on the main board near the CAT jack that acts like a fuse. It's an SMT component, so it's small... you'll either need to replace it yourself (if you're good with SMT) or send it to Yaesu for repair.

If you have "inserted a Jumper" between pins 2 and pin 5 then you have just shorted the 13.8 volts available on pin 2 to ground!
You would have blown the internal surface mount fuse which protects the rig in this very circumstance.
Check your circuit diagram.

I have noticed that this rig is pretty susceptible to RF feedback and similar problems, especially on certain bands. When I transmit on 440 with my PSK cable plugged in, for example, the radio hangs on TX for a second...

Are you running this antenna indoors? A couple of things to check: If you have an antenna analyzer, make sure you've got the antenna resonant. Also, don't run an anenna withiin 50' or so of your radio. I've heard of strange things happening. We just had a discussion about the keyer blowing up when operating portable, for example.

Heh. We just had another post talking about a bad CAT plug.

In short: don't use the CAT plug. It's easy to blow the surface mount fuse, in which case it's a trip to Yaesu for a repair. Run it on external power (there are lots of options... I've even seen one guy mount a pair of binding posts on the back of his radio near the power port.)

I had a similar problem with the same equipment and solved it by putting a 1:1 balun in the antenna line. Seems RF was getting in either the tuner or the radio and keeping the radio locked in XMT. I used a balun from Balun Designs, but you may be able to solve the problem with a simple coax choke of about eight turns of coax. If not, get a commercial balun.

You wind about 10' of coax at about a 6" diameter. this is supposed to help prevent RF from coming back on the shield.

HRD doesn't use a Signalink because the Signalink is not a CAT adapter, it's an audio interface.

To use HRD and Digital Master 780 together, you do need both a sound card interface (such as the Signalink) and a CAT connection to the radio, hence the two different connections.

it sounds like you've been bitten by the keyer bug.

We just finished a conversation about this: apparently, there's an RF feedback problem that occurs when you're to close to the antenna...

If you will check back a couple of messages on the archives, theres a post that talks about replacing a couple of resistors with higher-wattage units.

Also, if you're using a straight key or an external keyer, you can actually key with the data port. Put the rig in CW mode and connect the key acrooss the PTT and ground lines. I've accidentally triggered a CW tone more than once while working on an accessory going through the data port.

26766. Re: [FT897] Accessing the features

Yahoo group: FT897 (2009)
Date: 2009-07-09 05:25:22 UTC
From: Thomas Wilson
Topic: 26755 Message: 26766

Are you saving the tones to memory locations? The tone is not saved for each frequency... it's global. If you set it to 107.2, it will stay that way as long as you're in VFO mode (at least on that band...)

If you manually tune to 147.05 and set the PL to 100, then tune to 145.1 and set the tone to 107.2, then tune back to 147.05, the tone isn't going to resset automatically to 100...

what you have to do is set up your radio for a repeater, make sure you can talk on the repeater, then use the MW button to save the setting. you have to long-press MW once, use the Dial to find an empty memory location, then long-press MW again. to recall that repeater's settings, use the V/M button on the top-right of the radio.

As to the Skip feature... pressing it hides the menu item. You can show all the hidden menus by going to the first menu item and turning it ON. I spent about 20 minutes one day just going through and choosing the menu items I use most and un-skipping those (hiding the rest.) Now I only have to flip through about 10 menu items instead of something like 80.

26767. Re: [FT897] Signalink USB

Yahoo group: FT897 (2009)
Date: 2009-07-09 05:31:42 UTC
From: Thomas Wilson
Topic: 26754 Message: 26767

I have used this combination successfully... the LDG tuner only uses the CAT port for power, so you can use the second CAT connector on the tuner to control the radio. Set the radio's CAT/TUNER menu to CAT. If you use the one-touch cable, you can tune by just pressing the button on the tuner.. If you don't use the one-touch cable, you need to key the radio in AM mode, then press the button to tune.

The Signalink USB does a good job with this radio, but the audio output on the data port is pretty weak; you'll probably want to plug in the receive sensitivity jumper... I'm not using it on mine, and with the RX knob turned all the way up, I don't get very strong receive audio. It's fine for PSK work, but it's no good for Echolink or audio recording. However, my external Creative sound card gets plenty of signal from the same connector.

One thing you can do is experiment with the jumpers. Rather than using the 1200 pin on the data portfor PSK audio, use the 9600 pin. This has a slightly hotter signal, but the line is not squelched... so it won't work for Echolink or recording, but it will give you a stronger trace on PSK.

Hello Ben,

I've found my 897 reacts strangely to RF coming back own the coax (at least I think that's what it is). I have an inverted L that happily turns the fast tune on and off when I'm on 80m SSB. My guess is it might be able to turn the radio off if I was on CW (I am guessing here mind).
My 897 once did a full reset. I can only put this down to a similar sort of thing.

Has anyone else had strange happenings with their 897?

Subject: [FT897] Dangerous problem??

Hello all,

I made an experimental 50 MHz antenna according to instructions by Brian G0IER. (http://www.qsl. net/g3pto/ 6m_dipole. html)

Something apparently went wrong. When I tested transmission with 5 watt minimum power and keyed the cw key for a second, the rig FT-897 went off and completely blank for a second. The lights off etc. Using FP-30 power supply. I thought something catastrophic happened but when testing on another band I found the rig is working still at least for the time being normally.

Wondering if that is a normal reaction when e.g. there is a short circuit in antenna or something similar. Has anybody experienced the same. Could I have damaged something in 50 MHz band? I do not have another antenna for that band and I did not dare to test the same antenna agin.

Ben

Yes it works !

Done in three FT-897D and two FT-857D. Works great and the "train sound with open window" is drastically reduced, on FM not hearable anymore - and on SSB drastically lower or also not hearable.

The only disadvantage is, that the MAIN UNIT needs to be removed as the wire only can be set on the down side of the PCB.

26771. Re: voltage display mystery

Yahoo group: FT897 (2009)
Date: 2009-07-09 09:23:25 UTC
From: Dave Nelson
Topic: 26771 Message: 26771

Hi Adrian,
you still havent said WHERE you measured the voltage ???
At the PSU terminals or at the transceiver end of the cable... If as I am guessing you measured the minor V drop at the PSU terminals then your radio display is telling you what everyone else has been telling you .... ;)
it is showing you the voltage drop across the cable between the PSU and the transceiver :) This WILL happen, you CANT avoid it and the more power out the bigger the drop will be .... you can only lessen the drop a bit (its all relative)
by the use of BIG cables ie ... as thick and as short as practical :)
AND of course a a PSU that doesnt sag under hi current load
On HF/6M 100W out its gonna draw ~ 20-22Amps !!!! My switchmode PSU is rated at 40A on peaks ie WELL above max current draw of the radio

my 897D shows 13.6V in the display
on 70cm FM (with full output, 20W) my display V drops to 13.0V
on 2m FM (with full output, 50W) my display V drops to 12.7V
on HF and SSB mode and brief whistles into the mike ...
ie ... producing ~ 100W out it can drop closer to 12V 12.2-12.5 area

I have ~ 2ft of reasonably heavy cable from PSU to rig and I could definately improve those V drops if I so desired I'm not particularly worried abt it

and I will shout it from the mountain tops to all who complain abt their FT897's ;)
I LOVE MY 897D Damn its a great radio it "IS THE BEST" value for money of any multiband - multimode tranceiver out there

cheers
Dave

From: Darren S
Topic: 26698 Message: 26772

The hardware and software approach both effectively change the country code of the radio so repeater offsets are effected. You can but repeaters in memory though.

Subject: [FT897] Re: ft-897 firmware. Is it updateable

What about the repeater offsets??? When you do the hard mod, you loose them. Will this help??? My 897 (non D)had the mod done when I bought it used. If the repeater offsets can be restored, I will un-do the mod and do it this way.

I had the same problem recently. The SMT fuse for the CAT port had blown. My 897 is still under warranty so I sent it back to Yaesu. The radio was quickly repaired and returned to me. All I paid was to ship it to them. Yaesu paid to send it back to me.

If I recall, I believe that is a 2.5A SMT fuse. If this happens again, when it is out of warranty, I will change that fuse myself.

Good luck

It works great.

I was very disapointed with this "bug", the noise was earlable on my TX monitor. Afther this fix it's great! You have to be carefull, you need to remove the main unit. If you are not confortable with this, document yourself the best you can about opening the FT-897.

The US models have (or had) two SO239 whereas the EU models have had SO239 for HF/6m and N-type for 2m/70cm since the D model or before. Can't say which variant they ship in other territories or whether it's changed in the US or EU at any time during production.

>
I use this combo w/my 897D and it works great. No low audio out of the data jack on my end, the rx gain is set below halfway, tx gain set about 1/4 for 30 watts output. Works great, all I did was set the initial jumper settings for the radio, didn't have to set any jumpers for extra audio output or anything. The best interface for digital modes in my opinion is the Signalink USB. I use HRD and DM-780, and they are great, you can do almost anything with this combination.

Simon -

You might want to Google " UGLY BALUN." The length of cable used is usually dependent on range of bands you wish to cover.

Use of about 20 feet of coax wound around a form (Like a piece of 4" PVC pipe) will probably do the trick for you.

I have had a LOT of problems with RF through the CAT port... even putting chokes on the cable hasn't helped me much. I can basically crash my computer if I transmit on 20 meters with the cat cable plugged and my computer plugged in to my KVM switch...

Since serial port isolators can be pretty expensive, I'm considering trying to find a Bluetooth serial port adapter. It's just a little box with a Bluetooth radio and a DB9 port on the side. If I power that from the radio's power supply, that should *completely *isolate the radio from the computer.

Hi -

I do this on my rig. I built a short cable (.25m) with a male mini-DIN plug on one end and a female on the other. It connects between the radio and the CAT cable to the computer.

At one end of the short cable, I pulled the keying line and a ground out and connected them to an RCA plug for the linear. The computer does not need this signal for CAT control, and the linear doesn't need any of the other lines.

Works dead solid perfect.

Darren . . .

Early FT-897s for American markets were fitted with SO-239s for both HF and VHF.

Those slated for foreign markets had different connectors for VHF.

What Yaesu is doing with later batches and the "D" model, I have no idea.

There's nothing wrong with your rig. I've used mine on both HF and VHF with SO-239s since purchasing it in 2002.

Yaesu is notorious for making changes without explanations. They are also notorious for effecting upgrades without telling anyone or allowing retrofitting. Worse, they do their utmost to keep you from talking directly to a service technician (not the same as a service counselor).

This is why I no longer buy Yaesu products despite 30 years of purchasing them.

You might want to consider Elecraft next time for the opposite of all the above reasons.

Did you forget the offset? In the US, 2m offset is 600 Khz, while 440 offset is 5 Mhz. You will also need to know if it is a positive or negative offset. Check local ham group websites for the proper codes, offsets or consult the ARRL repeater directory or there are a few you can find online (don't know what the URL for the websites are - sorry!).

The off sets are programed in unless you have changed it. If they are set to automatic under repeater they will shift or not shift when they read your frequency if you are in the simplex range they will not change. Look at the top left on the display. When you see the "TON" you are adding a tone to your transmission. Remember that you should probably be changing the frequency when you turn the little side dial. If everything is working properly when you key up you should see the frequency shift on the screen. There are a few odd places that use a different off set, but I wouldn't worry about them. I was checking my radio and it wasn't showing an off set, it wasn't showing because I was in a simplex part of the band. Good luck. Let the radio do the thinking for you.

It should figure automatically which way is supposed to shift (+ or -), but find out if you need to set it. I THINK it is a positive offset.

Hello Jack

Looks and sounds like you are missing the "repeater shift" locked in for your Repeater / TX frequency, on the 145.280 Megs.

I do not know what repeater shift you have in your country,,, Here in Ireland, we have 2 M band repeaters,,, -600KHz,,, 70 cms Band +1600 KHz. ... Menu 76. then insert the ... (+ or -) and all will be well.

26801. Strange RIG behavior on power up usually due to PTT or key closure

Yahoo group: FT897 (2009)
Date: 2009-07-10 13:26:47 UTC
From: ve3wmb
Topic: 26801 Message: 26801

I am sure that this topic must have been discussed previously but I thought that I would mention my recent experiences hopefully to benefit any newcomers that have not yet seen this.

Let me start by saying that my FT-897D is well travelled as I carry it back and forth between home and my cottage (it is my cottage rig) in a Pelican case. This means that I am frequently disconnecting and reconnecting the rig.

What I had discovered previously and re-discovered last week was that if you plug the mic, key, digi-interface etc into the rig and power it up and it seems to be misbehaving (i.e will not change frequency despite the lack of LOCK) it is usually the result of the PTT/key being closed at power up. This seems to put the rig into a very funny state. If I recall correctly I had BK and KYR enabled but I ended up with a straight key plugged in with a mono plug so the rig was immediately in TX on power up and that seems to be the trigger.

The solution is of course to power the radio down then disconnect everything except for the power and the antenna and then power the radio back up. Then as you reconnect your key/paddle, mic etc you should then discover the culprit.

I had this happen once before when I accidentally pushed the LOCK button on my Yaesu Desk mic before connecting it to the rig and then powering up. Note under these circumstances the rig doesn't go into TX (if it did it would be easier to figure out) it is receiving, but you can't change the frequency, nor can you transmit.

Cheers,

Michael VE3WMB / VA2NB

Hehe...

I never considered that an issue, my daughter is forever pressing the
desk mic's lock button...I don't think I even power it down, just
clear the lock, and it's good.

26804. XMIT AFFECTING PC

Yahoo group: FT897 (2009)
Date: 2009-07-10 17:06:23 UTC
From: n3zjy
Topic: 26804 Message: 26804

I have read some threads about xmitting causing PC problems. My problems are usually while tuning in AM mode and include: audio buzz; screen flicker; and USB disconnect. I'm not sure what device is disconnecting but it usually reconnects. So RF is getting in somewhere. I obviously need some beads. I know mix 43 works well. Anyone have a good cheap supplier?

Simple to remember. For the most part, all offsets below 146.995 are -
0.600khz. Above that they are plus.

So, that makes 145.28 a minus offset.

UHF is almost always +5.00 mhz.

Don't worry about 220mhz!

Mike VA3MW

It should figure automatically which way is supposed to shift (+ or -),
but find out if you need to set it. I THINK it is a positive offset.

are set to automatic under repeater they will shift or not shift when
they read your frequency if you are in the simplex range they will not
change. Look at the top left on the display. When you see the "TON" you
are adding a tone to your transmission. Remember that you should
probably be changing the frequency when you turn the little side dial.
If everything is working properly when you key up you should see the
frequency shift on the screen. There are a few odd places that use a
different off set, but I wouldn't worry about them. I was checking my
radio and it wasn't showing an off set, it wasn't showing because I was

in a simplex part of the band. Good luck. Let the radio do the thinking
for you.

I'm assuming you have the computer and radio connected via a CAT cable.

I have the same problems. My USB-Serial port adapter will disconnect when I transmit on HF, leaving the radio stuck in transmit mode (When it's being keyed by software.) The problem is that RF is leaving the radio through your CAT or USB cable.

Do you have any problems when the radio is completely disconnected from the computer?

This is a ground loop... You have the computer and radio connected to ground at 2 different places, and you're getting an RF voltage across your ground lines. differential. Since the shortest path to ground is through your computer, the electrons are travelling from your computer's ground, through your USB cable, and in to the CAT port on the back of your radio.

Unless I miss my guess, your computer is grounded and your radio isn't. You might try running a nice, fat ground wire from the radio to your power strip. Keep it short, though... one way to do this is to buy a male power plug at Home Depot (or wherever), and just connect your ground wire to the power plug's ground pin. Then just plug it in to your power strip. By providing a shorter path to ground, you should prevent the worst of the RF from going through your computer.

If you still get problems, you can try lifting the ground on the computer. Get a 2-wire adapter while you're at the Home Depot, and plug your power strip in to that. This should leave your computer *ungrounded.* Run a second wire from the radio's ground lug to the little tab on the 2-wire adapter.

So you should now have 1 wire going from the outlet strip to the back of your radio and a second wire going from the radio to the wall. This should (fingers crossed) allow the RF to pass from your radio to the electrical ground without going through the computer. But it may increase RFI on your TV's or telephones.

Solution #2: If the above didn't work, try an isolated serial port. My solution was to get a Bluetooth serial port, such as the IOGear GBS 301<http://www.iogear.com/product/GBS301/>.
Since the computer is physically isolated from the radio, that should prevent RF from going back through your USB cable. I have one of those on order; it should be here next week.

In line withe the voltage is a very little fuse F1001, 3.15A. It is a very very smal chip-fuse, what can not even be seen by most of the readers here. If you want to buy one, the part number is KAB-2402-322NA31 an the YAESU Part number is Q0000087. I like to built the softrockboards with lots of smd parts, but this little damned fuse lead me to same very bad words against those enineers, who inventet this bullshit. I was not able to solder this little gimmick, so i wired a bypass with a inlinefuse from pin1 of the CAT/LIN socket to the next +12V point. Beware! thats no job for beginners with bad eyes.....55

I inserted a jumper to pin 2 (+13.5 volts) and pin 5 (gnd) and measured it with a multimeter set to DC voltage. It did not give me 13 volts. In fact, it didn't appear there was any voltage. I was to use the CAT/Linear jack to connect the LDG AT897 Tuner. It gets its power from the CAT/Linear jack per LDG tech. When I push the button to tune, nothing happens. He thinks it's notgetting power. I agreed, especially now after I measured it with a mutimeter.

Has anyone had a problem with the CAT/Linear jack not provided the voltage? Is there a fuse somewhere I can replace? Is there a way to fix this?

I don't know what else it could be other than a bad CAT/Linear jack

I ended up soldering a 3amp pico fuse to each end of the SMT fuse. The AT-897 Tuner works like a charm now.

Before I actually soldered it on, I confirmed no continuity between each side of the SMT fuse with my multimeter set to measure ohms. Then I held a jumper between each side, and measured the voltage from pins 2 and 5 on the jack, and got 13.5 volts. At that point it was just a matter of soldering the pico fuse in place. Ended being a lot easier than I thought. Saves the expense of sending it to Yaesu for repairs.

From: David Moorman
Topic: 26811 Message: 26811

Hello All-

I picked up an FT-897 and have used it on VHF so far. The plan is to put it in the car and do mobile HF and VHF, and a DTMF mic would be helpful there.

Does anyone have one for sale?

Thanks,

Dave K9SW

Topic: 26752 Message: 26812

Hi Jan,
I have the same issue here. The FT897D worked fine till two days ago. I was using it on 2m band, some repeater chat. Then the next day when I have it powered up the display started blinking on every band. There is also no audio but if I let it powered for some time (can be seconds or minutes) then eratically the display will stand still and the green RX led lit, there will be sound (like white noise with some barely heard transmissions - which are not heard by another trx in the same displayed frequency).
Also, if I try to press the PTT on any band (inside the ham radio allocated bands) the display will show "TX ERROR" .
The display stands still though if I get in settings menu via "F" button.
I have tried reseting it with V/M &F pressed at startup, changing antennas but still no joy. I am so upset eek.
Would be nice if anybody gives us some clue on what to do as I do not think that the rig is "dead".
Kind regards,
Gabi - YO4HEK

Hi all,

I just got an FT897, and its defective (noy my fault thou :-)).

When i turtn on the radio, the beep sounds, but nothing else, the display is blinking, but freq. etc. can be changed.

Radio is also willing to go in to the settings mode (like power/mod etc.)

I also did a reset of the radio, but no effect.

anny ideas ???

"jumper" was not the best term to use. I did not jump across from pin 2 to pin 5. I inserted separate leads to each pin on the jack, then measured the voltage across the leads with a multimeter set to measure DC voltage.

Of course, I gues you could have inferred that since I stated I used a multimeter to measure the voltage. If I had jumped it with a single wire across both pins, then I would not have two leads to measure the voltage with mu multimeter

From: Lew Phelps K6LMP
Topic: 26730 Message: 26816

I recently replaced this fuse, which is about as long (larger dimension) as a grain of rice is across the grain (short dimension. The fuse is 1mm x 2 mm. It is absolute hell to replace. I bought four of them from Digikey, and managed to lose three of them before finally getting one soldered into place. If I had to do it again, I would most certainly do it differently. The approach that I had considered was to remove the SMD fuse, solder small leads (1/8 watt resistor leads, for example) onto each of the pins, cut the leads to about 1/2 inch length, and then solder a mini cartridge fuse to the two leads. That would be MUCH easier, and would give the same protection.

Alternatively, one could use a small inline fuse holder, either for a cartridge fuse or for an automotive "spade lug: type fuse. There is ample room on the circuit board at that location; you could practically install a golf ball. I have no clue why Yaesu engineers designed this bit of circuitry to maximize the difficulty of replacing a blown fuse.

From prior discussion on this list, this seems to be a fairly common problem.

Dave:

Yes, RF is getting somewhere. The problem is that if you are chasing the symptoms by applying chokes and such to the PC you will be forever playing catchup as minor things change or you change frequency. The best approach is to fix the cause, which is RF getting to the vicinity of your computer.

Every installation is different and some antenna installations are so close to your equipment, house wiring, and home electronics, that it's all in the near-field and you will have to break those conductors up with chokes. In other situations, the antenna may be some distance away from what's being affected, but transmission lines, control cables, or even ground lines can be conducting RF into the shack and the vicinity of your computer.

Not knowing the particulars of your installation, I can't give you much specific help. In general, though, antennas should be reasonably well separated from your shack, house wiring, and anything else that may pick up RF, antennas should be oriented to help minimize coupling into those things, and the antenna should be configured to radiate as much energy as possible and not induce RF onto feed lines and such. This means having a good counterpoise or balanced antenna and appropriate baluns or chokes at the feed point (other than for open line feed).

I'm sure if you explain your situation further, you'll get more specific help.

Chuck - N8DNX

Rather than pay retail price, I picked up one EBay for quite a bit cheaper...

but look out for guys selling the mic for $30 and then charging $40 for shipping. Those are unethical sellers. They're selling an item cheaper to avoid EBay's fees; only buy from a seller that's charging around $10 or less for shipping. I think that, with shipping, I paid about $60 for mine.

Also, when you plug it in, go in and turn your SSB gain down to about 10. If I run it any higher than that on mine, I get severe overdrive... it's terrible.

In a word: don't.

You're better off using the power connector on the back of the radio (for a while, I just stuck the wires in the back of the power plug) or going directly to your power supply. I've also seen guys solder to the power leads inside the radio, bringing power out through the vent next to the power jack.

The port has an internal fuse that's *not* user-replaceable; it's easy to pop it and be stuck with no CAT port.

If I ever break my CAT port, I'm going to create a short extension cable... with the power line connected directly to the radio's power supply (with an in-line fuse, of course.) That should solve the problem. :-) That would also give me the chance to rig a breakout box for a tuner and/or linear.

26823. Re: [FT897] Batteries in parallel

Yahoo group: FT897 (2009)
Date: 2009-07-10 20:25:12 UTC
From: Thomas Wilson
Topic: 26819 Message: 26823

I've looked in to this before and discovered that half the "experts" I talk to say "bad idea", and the other half say "it's no problem."

Boats often use more than one battery for extended power; you'll see guys run 2 or more batteries in parallel to get the best possible run time. While this is done pretty often, some people don't like it, since a strong battery can discharge in to a weak one, cutting down your overall capacity.

Personally, I don't like running batteries in parallel. Even if the batteries don't equalize, there's more risk than gain. There's no real benefit to doing this: at best, you'll get the same total run time (with one exception... I'll explain that in a minute) as the two batteries by themselves. At worst, as the batteries age, one will wear out a little more quickly, causing an imbalance and eventually wearing out the other one even faster.

Now for the only reason you would potentially see a benefit: a battery will give fewer amp-hours when you're discharging it faster, but this ratio depends on a lot of things... at the amperage level of the FT-897 with large-capacity batteries, that difference may be pretty small. On a smaller battery (say a gel-cel), drawing current at 20 amps may reduce the total capacity more quickly. By running the batteries in parallel, you're drawing 10A off each battery when transmitting at full power (rather than drawing 20A off of one.)

In reality, the only thing that matters is your personal results. I would rig up a set of PowerPole connectors for each battery and your rig and get a PowerPole splitter. You can then plug both or just one battery in to the splitter, and you can swap batteries while your rig is still powered up.

Take a weekend and run the batteries down one at a time (with normal operation). The next weekend, try to run the rig for the same amount of time, but with the batteries in parallel. See if it makes a difference.

Then report back to us your results... include the make & model of the batteries you're using. :)

Good luck

26824. RE: [FT897] Batteries in parallel

Yahoo group: FT897 (2009)
Date: 2009-07-10 20:30:41 UTC
From: Ted Wrobel
Topic: 26819 Message: 26824

Hi Lou,

The textbook answer is NO, but the practical answer is YES.

While there are lots of theoretical explanations of the problem of mis-matched batteries, in the real world problems don't appear until one of the batteries is failing. Then the bad battery will drain the good one.

You could also see some problems if you were using a high-rate, multi-step charger with two very different batteries.

In the boating world the vast majority of boaters have two batteries and a three position switch - Bat 1, Bat 2, and ALL. Whenever the engine is running they will almost always switch in both batteries. Fancy battery combiners are nothing more than a set of relays that try to keep both batteries as the best charge level and prevent one from draining the other. Unless one battery has been discharged much more than the other, both batteries will be switched in at the same time.

I have worked this way with a pair of deep cycle batteries in my boat for almost 30 years. I get on average 8 years on a pair of batteries with the notable exception being the time I replaced only one battery. The new battery failed much more quickly than expected and I now replace in pairs.

Note however, that with a radio it is usually really simple to swap batteries - unless you absolutely must have continuous operation. In that case I would wire up a pair of powerpole connectors in a Y configuration. You can then plug in either or both batteries and can effectively switch in the fresh and unplug the depleted one. No need to keep them wired in parallel (except that it makes charging easier). There is no advantage to having both batteries connected at the same time.

Hope this helps.

Hi all,

This may be a dumb question but here goes: I have 2 same brand, same model number 35 Ahr batteries that I'd like to run in parallel to get 70 Ahr output for my FT-897D. Is this feasible or are there possible problems?

TIA,

Lou - W6UR

Why would you do that with an 897? It is NOT a mobile rig. It is a PORTABLE rig. If you want to do mobile, I would offer that you sell the 897 or trade for an 857. Same rig basically just different "packaging". The 857 is MEANT FOR MOBILE!

Hello All-

I picked up an FT-897 and have used it on VHF so far. The plan is to put it in the car and do mobile HF and VHF, and a DTMF mic would be helpful there.

Does anyone have one for sale?

Thanks,

Dave K9SW

Hi Tom and Ted,

Thanks to both of you for the excellent explanations which were you are basically saying the same thing. I suspected this may be the answer but I've never had an occasion to run 2 batteries so I had to ask. I believe I'll just run one at a time and not take a chance of ruining either one. I've already got a PowerPole splitter setup so there won't any trick to doing it. I'll be using the setup while at my mountain cabin for chasing DX which there isn't much of these days so I'm sure both batteries will last a looong time.

Thanks again and best 73,

Lou - W6UR

26827. Re: Batteries in parallel

Yahoo group: FT897 (2009)
Date: 2009-07-10 23:49:54 UTC
From: oceanbiz01
Topic: 26819 Message: 26827

Lou,

I own a manufacturing company. We make under water scientific instruments. These instruments are battery powered. All of our battery packs are made from stacks in parallel in order to get the desired amperage. However, each stack in parallel has a diode so that all stacks are Diode OR'ed to the red wire in the pack. That way, if one stack depletes prematurely, it does not drain power from the other stacks. This is normal procedure for parallel batteries, especially if you do not want damage to one battery by another.

So, go ahead and parallel them, just diode OR each one in parallel.

That's true, Dennis. I do have an FT-817, which I was going to put in the car, but the display and controls are rather small. It looks like the 857 is basically the same. The 897 is easier to read and use, at least for me. The other option, especially for my wife's car, would be a detachable face rig. Being a Ten-Tec person, I don't even know if Yaesu makes 160 to 70 cm detachable face rig.

The only ones I?ve seem on eBay have been in Hong Kong. They seem to run from $40 something to about $80, depending on whether shipping is included. It's available for $59.95 from Universal Radio. If a stateside one shows up I bid on that; otherwise a place like Universal.

Thanks for the suggestion about the SSB gain.

Well, thanks to all. This should close this thread.
Mine was also a filter, although with the symptoms, I believe that it was really one of the switching diodes, either before or after the filter. I took the radio to VS and they replaced both CF1005 and D1076/D1078. This did cure the problem. And, since they did not give me the parts, I had no way to inspect them. The diodes are cheap enough (USD$0.44 each). The filter is also pretty cheap at USD$10.00.

At least this did show that this constant static crash without antennas connected was, indeed, an internal problem. As I had suspected all along.

Once again, thanks to one and all...

Dan,

The diodes are a great idea in the event of a battery failure, but I have a comment. I can see where they'd work well if you were building, say, a nominal 7.2 volt Ni-MH pack which would feed a regulator for a bus voltage of 5 V for logic circuits. Or any system where the battery voltage is significantly above the desired circuit voltage. But it seems there would be a problem with the voltage drop through even a good Schottky diode when the end use device needs the full battery voltage.

For example, my FT-897D is rated at 13.8 VDC ? 15%. That gives it a voltage range of 11.73 - 15.87 VDC. Using a diode, I'll be giving up approximately 0.3 V (or more) through the Schottky. This means that I'll be out of the factory approved voltage range for the radio at a battery voltage of ~12.03 volts. Approximately half a volt above the safe discharge level for the battery. So, I'll be losing a percentage of battery capacity because the diode is accelerating the low voltage cutoff point due to its loss.

Admittedly, the capacity can be regained by adding another battery or two, but given the cost of good AGMs these days, that's not a do-able solution for many hams.

There is a lot of equipment and virtually every renewable energy system in existence utilizing multiple paralleled batteries without the diode protection. I've used multiple batteries in parallel, both AGM and flooded-cell, for many years, including 19 months off-grid on a wind generator, without diode OR gating. And never had a problem.

While I like the idea for certain applications, especially when you need a 'fail-safe' power source for mission critical gear such as your undersea equipment, I don't believe that it's economically feasible for most ham power applications.

It would also require a more complex charging connection, since you could not simply connect the charger across the bus due to the diodes blocking the charging current.

It is a truly elegant solution, but I don't believe that it is applicable to most amateur radio battery power systems.

Dave,

The 857 is basically the 897 in a different case, with a removable faceplate. I have two 897Ds and contemplated putting one in the pickup. But it's just too big for the space I have, so I'll be getting an 857D for the mobile console I'm building and keeping the other 897D for a 'grab it and go' radio in the event of an emergency deployment. Universal Radio is currently throwing in the $51.95 separation kit as a bonus when you buy the 857D for $729.95.

Hello again Jack,

Only other possible cause I can think of,, if they can hear you, and you can hear them,,, frequencies being used woud seem to be correct ??? What power level are you transmitting ??? If vry low power output ,,, perhaps ,,, no reading on meter ??? or,,, meter not performing !!
Other option,,, check power out with a watt meter, or an SWR Meter !!

Best of luck _____ Peter EI4HX

Ive had this happen a couple of times with thee lock button being depressed at turn on and also had the mike left open for a couple of hours transmitting the goings on of my colourful household to the eager listeners that are ever present...lol :-)

It worried me so much that I decided to disable the lock down button on the MD 100 .This can be done in a couple of ways I.e disordering or blocking the micro switch. I decided to go the blocking route by cutting a very small amount of a throw away biro type pen and popping it on top of the micro switch and re-assembling the switch mechanism. This then keeps all the wiring un molested and stops the lock button from being depressed.

Just thought my tip might save someone the embarrassment I suffered....LOL :-)

Hi Dave,

I use a FT 897, FT 857 and a FT 817 and I have found that the mic from a Yaesu FT 2400 (2m mobile rig) fits and works fine. You should be able to pick up a used 2400 with a working mic for under $75.00 if you check ebay or your local swap lists etc... Its like buying the mic and getting the radio for free...

I respectfully but strongly disagree with the assertion that the FT-897 is "not a mobile rig." It is larger than the FT-857, but not too large to use as a mobile rig. I have devised mobile mounts for the FT-897 that work perfectly well in three relatively small vehicles, including a Toyota Prius and a Saab 9-3. These installations are secure (in event of a crash), provide ready accessibility to radio controls, and don't steal space from any passengers. If you exercise a little ingenuity, an FT-897 can be installed in any vehicle I am aware of.

Why go to the trouble? Because then you have the benefits of the "portable" FT-897 AND a good mobile rig -- two radios for the price of one, if you will. I used to own an FT-8900, a true "mobile" radio with a split head. While the split head made it easy for installation in a vehicle (main body goes in the trunk), removing it to use as a base station rig was a real PITA. If you can afford multiple rigs, and if you don't mind the smaller knobs and readout on the 857, then it makes sense to get an 857 for dedicated in-vehicle use. But if you only can afford one rig, I think that the 897 is the best choice. In any situation other than in-vehicle installation, it's superior to the 857 on ergonomics, and with its internal power supply and/or batteries. Since it CAN be functionally installed in even a small vehicle, I think it's the best choice for "one rig that does it all."

From: tenorman1952
Topic: 26819 Message: 26840

Batteries in parallel, I 've seen used in trucks four 6 v batteries in series parallel or two 12 v in parallel.

I have a pair of sealed lead acid (gel cell) batteries with a parallel wiring harness that I just used for Field Day. It is a RBC-6 pack, which is sold as a pair of 12 v 12 AH gel cells for a total of 24 AH.

It worked quite well. No parallel diodes used.

Perhaps I should split the harness with a DPDT (center off?) switch to switch between them. I would prefer to not have the voltage drop of a diode.

Starting out freshly charged, 12.88 v receiving, 12.8 v while transmitting.

Halfway through the afternoon, 12.8 v receiving, 12.7 v transmitting.

When we quit for the evening, 12.7 v receiving, 12.6 v transmitting.

This was in SSB mode at 100w.

The theory is that series circuits (Batteries in series) you add the voltages together but the current remains constant. In parrallel you add the currents but the voltage is constant but this only works back to back. face to face can cause a stronger one to leak into a weaker one. In theory.

From: Thomas Wilson <wilsontp@...>
To: FT897@yahoogroups.com
Sent: Friday, 10 July, 2009 21:25:12
Subject: Re: [FT897] Batteries in parallel

I've looked in to this before and discovered that half the "experts" I talk to say "bad idea", and the other half say "it's no problem."

Boats often use more than one battery for extended power; you'll see guys run 2 or more batteries in parallel to get the best possible run time. While this is done pretty often, some people don't like it, since a strong battery can discharge in to a weak one, cutting down your overall capacity.

Personally, I don't like running batteries in parallel. Even if the batteries don't equalize, there's more risk than gain. There's no real benefit to doing this: at best, you'll get the same total run time (with one exception... I'll explain that in a minute) as the two batteries by themselves. At worst, as the batteries age, one will wear out a little more quickly, causing an imbalance and eventually wearing out the other one even faster.

Now for the only reason you would potentially see a benefit: a battery will give fewer amp-hours when you're discharging it faster, but this ratio depends on a lot of things... at the amperage level of the FT-897 with large-capacity batteries, that difference may be pretty small. On a smaller battery (say a gel-cel), drawing current at 20 amps may reduce the total capacity more quickly. By running the batteries in parallel, you're drawing 10A off each battery when transmitting at full power (rather than drawing 20A off of one.)

In reality, the only thing that matters is your personal results. I would rig up a set of PowerPole connectors for each battery and your rig and get a PowerPole splitter. You can then plug both or just one battery in to the splitter, and you can swap batteries while your rig is still powered up.

Take a weekend and run the batteries down one at a time (with normal operation). The next weekend, try to run the rig for the same amount of time, but with the batteries in parallel. See if it makes a difference.

Then report back to us your results... include the make & model of the batteries you're using. :)

Good luck

Hi, Lew. The 897 is NOT a mobile rig by design. While it is larger than the 857, it is MUCH heavier, therefore making mounting extremely difficult. Most locations within a vehicle will not support the weight of the rig without breaking or damaging something EVENTUALLY!. If you set it on a seat or fabricate some type of mount is all well and good, however, plus the 897 I do not believe is "mobile rated", i.e, designed and built to resist vibration, shock and the like that a mobile rig would be subjected to. I am not saying that it couldn't be done, all I am pointing out is that the 897 wasn't designed for a mobile application. If it was, I seriously believe the case and internal components would have been designed differently and it wouldn't be as heavy as it is. Plus, the 897 is MARKETED as a portable not a mobile. Plus, the fact that the face does not detach (NOT that it has to), there are no commercially available mobile mounts that even the manufacturer WOULD HAVE SUPPLIED, or at the least, manufactured and made available as some type of option or separate purchase (like the separation kit for most other mobiles).

Hell, you can mount the FT-DX9000 in a vehicle if YOU fabricate a mount for it, but again, the DX9000 wasn't designed as a mobile, either.

But, anyway, we agree to disagree and that's cool.

To each, his own! If it works, cool!

26847. Re: [FT897] Looking for a DTMF mic

Yahoo group: FT897 (2009)
Date: 2009-07-11 17:43:13 UTC
From: Lew Phelps K6LMP
Topic: 26811 Message: 26847

Dennis:

Yaesu defines the FT-897 as a mobile rig, and markets it as such; see their web site.

As others have noted, Yaesu provides a mobile mount bracket. This can be attached either directly to the dashboard or transmission hump on many vehicles, or to any of a number of commercially available mounts designed for radios and laptops, which bolt to the transmission hump and allow positioning of the rig so that it doesn't interfere either with vehicle operation or passenger space.

The 897 weights 8.6 pounds without an internal power supply or batteries, and about 10.5 lbs with the internal power supply. The FT-857 weighs 4.6 pounds. I do not consider 4 or 5 pounds to be "MUCH heavier from an absolute standpoint (although obviously approximately double the weight of the 857 on a relative weight basis.) From my own experience (3 smallish sedans and two off-highway vehicles), I would say that it is definitely NOT difficult to fabricate safe and secure mounts for the 897.

Since Yaesu specifically describes the 897 as a "mobile" rig on its website, I believe that "mobile rated" is not an issue. It shares about 90% commonality in components with the 857. I have used my FT-897 installed in off-road four wheel drive vehicles, driving over extremely rugged terrain, and I've never had a vibration-caused problem with the 897.

Dennis, I don't believe you are correct in stating that the weight of the 897 will cause something to break eventually if installed as a mobile rig. My experience with multiple vehicles says otherwise. I had it installed in a Jeep Grand Cherokee that was rear-ended and totaled, and the radio itself didn't move and didn't damage the mounting point. I have had it installed in a Pinzgauer 710 (4 wheel drive military surplus vehicle) that I rolled onto its side on a Jeep trail, and again, no radio-caused damage to the vehicle or to the radio. I also believe that you are wrong in stating that "there are no commercially available mobile mounts" available for the 897. Google on "vehicle radio mount" and "laptop radio mount" and you will find plenty of commercial options, in addition to Yaesu's own bracket.

Although Yaesu doesn't make a separation kit for the 897, I believe that at least one intrepid member of this forum has home-brewed a head separation kit, and described it here. Check the archives.

The 897 is not designed as a one-purpose mobile rig. The 857 was designed for one specific purpose and does it well. However, that

does not render the 897 unsuitable for mobile installations. Having used both mobile-specific rigs and the 897 for in-vehicle use, I prefer the 897. It's big enough to do lots of other things besides serving as an in-vehicle mounted mobile rig, but small enough to be installed in a vehicle without taking over the passenger compartment. Not many all-band all-mode transceivers can make that claim.

26850. Re: [FT897] FT-897 as Mobile Rig (Was: Looking for a DTMF mic)

Yahoo group: FT897 (2009)
Date: 2009-07-11 20:00:42 UTC
From: Lew Phelps K6LMP
Topic: 26811 Message: 26850

Sorry; we should have re-titled the thread a long time ago, which I have just now done. It segued into a discussion about whether the FT-897 is a legitimate mobile rig, which I believe is a meaningful discussion topic for this list. The segue occurred after the original poster said he was looking to use the 897 as a mobile rig and thought a DTMF mike would be useful; another member of the group responded to say, essentially, if you want a mobile rig you should get an 857, because the 897 isn't designed or intended for use as a mobile rig.

A thoughtful discussion has ensued, and I hope it continues, because I believe the 897 CAN be deployed effectively as a mobile rig, and the topic is generating some good discussion on different approaches to mounting the 897 in a vehicle for mobile use.

Well...Fortunately, in Ham Radio, opinions are what it is all about...99% of all equipment is purchased on 'opinion'. Facts are few and far between and only available from the factories. Facts are what is printed about the equipment. But..does it work? 'Opinion' is really tells us about that equipment.

So..let's keep the opinions....that is what I am interested in.

Don't be so quick to accept factory "facts". There is this thing called Specmanship which is what Marketing departments are all about. An example is this. There is a ham who I will leave un-named at present who has run NEC models on all 6 meter antennas that have been built, homebrew and commercially made. The commercially made antennas, to a large extent, have been overstated in their gain specs. His analysis has shown this.
So, if you want the real facts, go to an independent source for test results. ARRL is one such place and their are independent people who do the same.
Now, I will qualify my statements here by telling you that I am a business owner and Sales and Marketing specialist, so I know of what I speak.

Dennis - There is a mobile mount manufactured by Yaesu, part number MMB-80. I have one.

I also BINed an FT-857 today and will try that out. If the ergonomics are doable, I'll install that in the car and sell the 897.

The car is a 1999 Avalon with a bench front seat, so there is plenty of room for the 897 on a pedestal mount. In most other cars, mounting it without taking up passenger room, such as Lew has done, would take a bigger effort. As far as I'm concerned, easier is better!

From: Andy Digby
Topic: 26731 Message: 26855

Hi - there does appear to be an issue with some editions of the FT-897 on 50 MHz and I think I have one of them !

I hooked up a known good 50 MHz antenna to the HF / 6m port and started looking for beacons - nothing. Seemed odd.

I borrowed a mobile radio test set from work that weekend and ran a few checks like receiver sensitivity etc. The HF / 6m port was down to -95 dBm when the 6m signal I was injecting into the port disappeared. Hmm, somewhat deaf methinks.

Then, just for badness, I tried the same signal injection on the other port (144 / 430 MHz) and lo and behold, -113 dBm achieved for a good 10dB SINAD. The signal disappeared around -118 dBm.

Checked the transmission path and power was definitely coming out of the HF / 6m port and was in concordance with the menu setting. 5W to 100W all checked out OK into a known good 50 ohm load.

So I am suspecting a pin diode or something similar in the RF switching circuits right at the front end rather than a mis-directed physical connection. It could even be a FET of the right type but with the wrong specific characteristics.

Anybody else had similar experiences ?

My FT-897 certainly didn't switch itself off or glitch in any way.

Hi - there is a perfectly good MH-59 DTMF mic on the market that works just fine with the FT-897. I tend to swap my MD-1 base mic or MH-31 mobile mic out for the MH-59 DTMF mobile mic if I am using a repeater that has an Echolink node attached that needs DTMF commands.

Alternatively, get a handheld battery operated DTMF tone generator.

26859. Inconstant level of the white noise

Yahoo group: FT897 (2009)
Date: 2009-07-13 08:51:57 UTC
From: ok1fig
Topic: 26859 Message: 26859

Hello all,

I own and use the rig for years. Now, all of sudden, a strange behaviour occured.
When I disconnect antennas and tune accross a band, the level of the noise that the radio produces is not constant. It is rising then lowering than rising then lowering, etc etc, like a sine curve. The period seems to be around 150 kHz.
It is most obvious on lower HF bands, such as 160 and 80 m.
I use internal PSU.

Did anybody of you experienced anything like that?

Thanks for any hint, 73, Petr, OK1FIG

26860. Re: [FT897] Inconstant level of the white noise

Yahoo group: FT897 (2009)

From: Charles Scott
Topic: 26859 Message: 26860

Petr:

This sounds like it might be local noise from something pretty close to your radio, but I suppose it could be an internal problem (I had heard some of the internal supplies did generate some noise).

What is the level of this noise? (S-Units?)

Do you have an antenna tuner connected and just disconnected the antenna line from the tuner?

Do you have a computer, monitor, or other similar thing in your shack? If so, you might want to turn it off and try the test again.

If neither of the above, then can you try connecting the radio to an external power supply to see if that makes a difference.

Did you have to activate any menu functions to make it encode dtmf codes? Someone in this group said that radios previous to a particular serial number would need to be sent to the service center for reprograming to use the mh-36.

You might also try terminating the receiver with a 50 ohm dummy load and see what happens. A true test would be to see if the signal to noise ratio actually changed from band to band given a constant level input from a 50 ohm signal generator.

FP-30 188 135
Built in AC Supply

YF-122C 143 95
Collins Mech Filter

YF-122S 143 95
Collins Mech Filter

945

The above unit is assembled as shown but could be split up

The following is the complete Yaesu battery setup

Model # new ask

FNB-78 two 99/each 50/ea Internal battery
option

CD-24 107 65 Charger
for batteries

PA-26 76 50 AC
supply for charger

Includes bottom cover plate 215

Model # new ask Description

FC-30 215 150 Matching
antenna tuner

MH-31A8J 37 25 Microphone

MH-59 74 45 DTMF
microphone

Will split to the extent possible or sell all for $1,000.

Hi Rob

Thanks for that explanation. I do appreciate it and I take your expertise as reference. We are never too old to learn something new to us.

Subject: Re: [FT897] Hole Current (was Re: batteries-12 volt, 6 cell, lead-acid vs FT-897)

Dan,

Since this is part of my area of expertise, and this is a pretty basic question, I consider myself to be one reference.

Just for you, I did some quick research. The IEEE Dictionary defines hole as: "A mobile vacancy in the electronic valence structure of a semiconductor that acts like a positive electron charge with a positive mass."

The valence structure of a metal is quite different from doped silicon, so there are no holes in conductors.

Unfortunately, a good explanation is not short, so I would suggest further research if you are interested.

There are a number of textbooks on the subject. A search of Amazon would give you a number of choices. Search for "semiconductor physics".

In a semiconductor, in the presence of an electric field, the holes and electrons do move in opposite directions. Since the charges are opposite the "conventional current" moves in the direction of the holes and includes both the hole and electron current contributions.

Please point me to a piece of reference material which excludes
evrything (including copper) except semiconductors. It seems to
me that when an electron leaves it's orbit, it leaves a hole
behind, regardless of the material, no matter the material. I am
open to being educated here.
And yes I know that hole current is not exclusively AC. As the
electron moves east, the hole moves west, or perhaps the hole
remains in place waiting for a new electron. But the hole at
least appears to move in the opposite direction.

From: Dan Schaaf
Topic: 26819 Message: 26866

Hi Larry

yes, you are correct. Our equipment is mission critical. Ham gear is just a hobby. If the ham battery dies, you go outside and play with your kids and have a barbeque. Hopefully people do that anyway, even when the batteries are OK HiHi
Our batteries are not rechargeable so power management is critical.

Best Regards

Subject: Re: [FT897] Re: Batteries in parallel

Dan,

The diodes are a great idea in the event of a battery failure, but I have a comment. I can see where they'd work well if you were building, say, a nominal 7.2 volt Ni-MH pack which would feed a regulator for a bus voltage of 5 V for logic circuits. Or any system where the battery voltage is significantly above the desired circuit voltage. But it seems there would be a problem with the voltage drop through even a good Schottky diode when the end use device needs the full battery voltage.

For example, my FT-897D is rated at 13.8 VDC ± 15%. That gives it a voltage range of 11.73 - 15.87 VDC. Using a diode, I'll be giving up approximately 0.3 V (or more) through the Schottky. This means that I'll be out of the factory approved voltage range for the radio at a battery voltage of ~12.03 volts. Approximately half a volt above the safe discharge level for the battery. So, I'll be losing a percentage of battery capacity because the diode is accelerating the low voltage cutoff point due to its loss.

Admittedly, the capacity can be regained by adding another battery or two, but given the cost of good AGMs these days, that's not a do-able solution for many hams.

There is a lot of equipment and virtually every renewable energy system in existence utilizing multiple paralleled batteries without the diode protection. I've used multiple batteries in parallel, both AGM and flooded-cell, for many years, including 19 months off-grid on a wind generator, without diode OR gating. And never had a problem.

While I like the idea for certain applications, especially when you need a 'fail-safe' power source for mission critical gear such as your undersea equipment, I don't believe that it's economically feasible for most ham power applications.

It would also require a more complex charging connection, since you could not simply connect the charger across the bus due to the diodes blocking the charging current.

It is a truly elegant solution, but I don't believe that it is applicable to most amateur radio battery power systems.

I am not sure where to put this, but I wanted to make it available to my Bay Area friends before I post it elsewhere. If this is not the correct spot, could someone kindly move the posting to the proper spot.

Yaesu FT-901DM (Excellent condition!!!) with SP901, mike, AC and dc power connectors. Has fan option installed. Friends have described this as close to showroom as they have seen. $550 I will be selling this radio this week. Please pass this on to any interested ham. I would prefer to sell this locally and not have to ship it.

I can meet someone at Big Bend and US Hwy 301 off I75 Exit 246.

Detailed pictures here: http://gallery.me.com/rvbcave#100049

Subject: Re: [FT897] FT897 Blinking display

Hi Jan,
I have the same issue here. The FT897D worked fine till two days ago. I was using it on 2m band, some repeater chat. Then the next day when I have it powered up the display started blinking on every band. There is also no audio but if I let it powered for some time (can be seconds or minutes) then eratically the display will stand still and the green RX led lit, there will be sound (like white noise with some barely heard transmissions - which are not heard by another trx in the same displayed frequency).
Also, if I try to press the PTT on any band (inside the ham radio allocated bands) the display will show "TX ERROR" .
The display stands still though if I get in settings menu via "F" button.
I have tried reseting it with V/M &F pressed at startup, changing antennas but still no joy. I am so upset eek.
Would be nice if anybody gives us some clue on what to do as I do not think that the rig is "dead".
Kind regards,
Gabi - YO4HEK

Hi all,

I just got an FT897, and its defective (noy my fault thou :-)).

When i turtn on the radio, the beep sounds, but nothing else, the display is blinking, but freq. etc. can be changed.

Radio is also willing to go in to the settings mode (like power/mod etc.)

I also did a reset of the radio, but no effect.

anny ideas ???

Hi
Wonder if someone can help ?

I am putting a differant mic on my FT897.
In the manual the mic socket is shown as having a mic ground and a ground
Can I join together the mic gound and the gnd copnnections on the microphone plug as my mic doesn't have a seperate mic ground ?

Tnx es 73 Iain G4DPF

26871. Re: Inconstant level of the white noise

Yahoo group: FT897 (2009)
Date: 2009-07-14 06:46:19 UTC
From: ok1fig
Topic: 26859 Message: 26871

Thanks all for the answers.
I played with the rig a bit more yesterday again. I revealed that the internal PSU is to blame. I connected the external PSU and was switching the internal one on and off for the test.
The noise was most heard on 160 and 80m and also on 10m band. It was not audible on 2m and 70cm.
I removed the internal PSU - the noise was not audible when switched on on the desk. I put a piece of wire into the ant connector and let it lie over the internal PSU - the noise is audible again.
Definitelly something happened with the PSU because I would have noticed the inconstant noise before.
I wonder whether a healthy PSU would make some noise as well. The test is simple. Use external PSU, tune to 80m band, disconnect both antennas and switch the internal PSU on and off repeatedly.
Can anybody make such a simple test?

Thanks, 73, Petr

Did you have to activate any menu functions to make it encode dtmf codes? Someone in this group said that radios previous to a particular serial number would need to be sent to the service center for reprograming to use the mh-36.

Yoooo bedankt voor de info.
Thanks, that gives a clue, so i will be looking in the pll cirquit.
Anny more tips on this ??

Jan

PE1IYQ / DL5MDN

No not really.

And I doubt that it can be easily fixed, unless it is caused by lousy adjustment(s) at the Yaesu factory - they do have a bad track record adjusting the bias currents of the driver and finals.
Page 11 of the service manual describes local oscillator and PLL adjustments. You might start with checking frequencies and output levels of the LO and the control voltages of the PLL loops, in that order. (although the PLL must be adjusted for 5 frequency ranges and it is unlikely that they are ALL unaligned.)

Regards,

Minto pa3bca.

AFAIR a blinking display means that the main PLL oscillator fails to lock.

Subject: Re: [FT897] FT897 Blinking display

Hi Jan,
I have the same issue here. The FT897D worked fine till two days ago. I was using it on 2m band, some repeater chat. Then the next day when I have it powered up the display started blinking on every band. There is also no audio but if I let it powered for some time (can be seconds or minutes) then eratically the display will stand still and the green RX led lit, there will be sound (like white noise with some barely heard transmissions - which are not heard by another trx in the same displayed frequency).
Also, if I try to press the PTT on any band (inside the ham radio allocated bands) the display will show "TX ERROR" .
The display stands still though if I get in settings menu via "F" button.
I have tried reseting it with V/M &F pressed at startup, changing antennas but still no joy. I am so upset eek.
Would be nice if anybody gives us some clue on what to do as I do not think that the rig is "dead".
Kind regards,
Gabi - YO4HEK

Hi all,

I just got an FT897, and its defective (noy my fault thou :-)).

When i turtn on the radio, the beep sounds, but nothing else, the display is blinking, but freq. etc. can be changed.

Radio is also willing to go in to the settings mode (like power/mod etc.)

I also did a reset of the radio, but no effect.

anny ideas ???

26874. Using an alternative battery charger for the internal battery?

Yahoo group: FT897 (2009)
Date: 2009-07-14 16:53:16 UTC
From: Richard Corfield
Topic: 26874 Message: 26874

I'm considering buying either the Yaesu internal battery pack or the W4RT one. I already own a battery charger for 11 cell NiMH packs sold by Lumicycle. This has just the two wires to the battery pack itself, no other sense wires or anything.

Is the pinout of the CHG connector documented anywhere? Would it be possible to use such a charger with the Yaesu battery pack?

Thanks

- Richard (M0RJC)

Nathan,

What are you trying to do? I assume your linux program is attempting to transmit.

Assuming it is running in vox mode, you need to be 100% sure the audio is being routed to the right device as well (the Signalink) and not the default sound device.

Is it connected to the Mic connector or to the data connector?

Does the PTT led light on the unit when you attempt to transmit?

I wasn't looking to buy, but was just inquiring about the dust cover; sorry I wasn't more clear. I was wondering if you bought the dust cover, and if so, where? I have an 897D with the LDG-897 tuner attached. I would like to find a nice dust cover for mine, but haven't found one yet. I think a company could do well making custom dust covers for amateur rigs, especially nice ones with the radio logo's on them.

If anyone knows of someone making dust covers for ham rigs, please let me know. I posted this in the list instead of off-list because I thought others would be interested as well.

Its also worth mentioning that you probably need the radio to be in DIG mode, I can't remember if the data port is fully functional in SSB mode.

It depends on your situation. The radio looks at a combination of the operating mode (FM/AM/SSB, DIG, PACKET, CW) and the AUTO CW menu item to determine whether to send audio from the rear panel or a CW tone with the data port's PTT line is keyed.

When you key the radio through CAT (such as when using Ham Radio Deluxe), data jack audio is only sent when the radio is in Dig or Packet modes. It will send microphone audio in any phone mode.

When you turn on the digital VOX mode, the radio will use the digital VOX sensitivity and digital gain settings (Packet gain in FM) to key the radio. It will always send data port audio when keyed by digital VOX. Note, there's no menu option to turn digital VOX on or off, you set the gain to 0 to disable digital VOX.

26884. RF isolation via Bluetooth....

Yahoo group: FT897 (2009)
Date: 2009-07-16 05:16:52 UTC
From: Thomas Wilson
Topic: 26884 Message: 26884

So I finally got my Bluetooth Serial adapter today... and it's pretty awesome.

Let me explain my situation: due to my computer setup, I get RF from the radio in to the computer when I try to work PSK with Ham Radio Deluxe and Digital Master 780. RF is feeding back through the CAT cable in to the USB Serial port, dropping the connection between HRD and the radio. It also feeds through my keyboard switch in to my other computer, eventually injecting RF in to the house's TV cable wiring. Because of my audio, video, and USB interconnections between both computers, I can't isolate the ground on either computer. The computer also feeds RF noise back in to the computer. The quietest setup on both TX and RX was to have the radio grounded to my grounding stake outside and leave the computers and cable TV grounded to the cold water pipe... with the radio NOT connected to the computer.

But I really wanted to use HRD, so the only viable solution was some sort of isolated serial port. Opto-isolated serial ports are expensive, so I thought about a bluetooth serial port. I picked up an IOGear BGS301 from Amazon and a Belkin Bluetooth adapter locally.

The Serial port was easy to set up: the DIP switch sets one of 8 possible baud rates, and pairing it with the computer's Bluetooth was simple. This created a new COM port: COM7.

So the next step is obvious: turn on HRD and tell it to talk on COM7. Everything went perfectly: I made several PSK CQ's on different bands and everything worked flawlessly. HRD never lost its connection to the radio, and the KVM switch didn't freak out like it had been.

The total cost of this little project was around $80: $64 or so for the serial port and $15 for the Bluetooth adapter. Considering the fact that everything "just works" now, I'm going to call this one a win.

26885. FT897d and ATAS 120a prob

Yahoo group: FT897 (2009)
Date: 2009-07-16 13:42:21 UTC
From: Steve
Topic: 26885 Message: 26885

Hi all, I have a ft857d with a atas 120a mobile and all is fine,
But when i tried the atas on my 897d I have a problem,
The 897 does not power the atas motor, all menu's are set correctly i.e menu 85 set to ATAS
ALL have tried the other settings too, when if MFk the tune up and down buttons have no effect at all,
ATAS does not appear or the screen either,
having the Duplexer inline makes no difference,
Have also tried the manual tune i.e PTT keyed and pressing the up or down buttons in MFk
Some points i've noted,

with the 897 I have a dc voltage of 3.93V on both rf connectors at the rear of the radio, now even if i set menu 85 to off the voltage is still there...

On the 857 there is no voltage present until a tune button is pressed,
Any idea's
Thanks
Steve

26887. Another interesting 897D behaviour:

Yahoo group: FT897 (2009)
Date: 2009-07-16 21:24:42 UTC
From: john_kb0ne
Topic: 26887 Message: 26887

Hi Group,
It would appear that my 897D doesn't like to run CW at 100watts...

Last night I had the 897D plugged into the 50 ohm dummy load and was going to test out my CW electronic keyer with a freshly rebuilt Vibroplex key. First up, everything in the shack is very well grounded and there is no RF leakage or SWR problems with the dummy load. The keyer uses shielded cable and I have NEVER have had a problem with my power supply with either the FT-897 or the FT950 or Drake TR7 while running full power SSB mode.

I turned toe 897D on, set the mode to CW and touched the keyer paddle. Immediately the 25 amp linear power supply went into current limit and shut down. Very interesting.

I reset the power supply and tried the 897D TX with SSB at full power (Long whistle int toe mic to get max power out) and no problem. Tried the CW at 50 watts and no problem but not wanting to tempt fate and blow the finals I didn't try CW again at 100 watts.

Has any one else had this experience?

John KB0NE

Hi John,

I've done psk31 with 100watts on my 897 when I was first learning the 897 and psk. Oops, you're not supposed to do that with 100% duty cycle digital modes.

The rig seemed fine, and I even got signal reports with no splatter. But I could definitely feel rf in the shack even though the rig is grounded.

I even worked a station in France using an attic dipole on 40m. But now I run around 15w on psk31.

Cheers,

Ron, KD0HNE

I've heard others say that anything over 25 watts is just heating the shack... even 15 watts will get you anywhere that your signal can propagate to.

I'm not completely sure about that, but after getting hammered by a guy in LA with just a few watts in to a dipole, I'm starting to believe it.

26890. Rig Problem

Yahoo group: FT897 (2009)
Date: 2009-07-17 01:37:43 UTC
From: Sam Saladino
Topic: 26890 Message: 26890

Looking for any suggestions, or information if anyone has had the same problem. Turned rig on tonight, powered up fine, received fine. Went to transmit to start the county ARES NET and rig did not switch from receive to transmit. Tried to change to another band, band change button does not work, mode button does not work, clarifier button does not work. Buttons across top V/M, Home and DSP all work fine. Buttons on left side of face and all dials work fine. Did complete reset no change. Called Yaesu, they were closed for the day so will have to wait until tomorrow. Rig just over 6 months old. Anything else I can try or dead in water until tomorrow?

Sam NW9T

If you have morse key plugged in, remove it and try again. Turn rig off first.

Also if you have a desk mic make sure that the lock button is not pressed.
It sounds like the issue I described last week where PTT (or key) is closed on
power up of the rig, and causes a strange lockup behaviour.

It appears that Jim's suggestion worked. I'm currently using the Hand Mic that came with the rig, but I WILL keep your comment in mind if/when I do gey a desk mic. Thanks for jumping in helping out.

From: Rob - W1AEX
Topic: 26890 Message: 26897

If the rig is inadvertently locked in transmit mode, from the cw key, the mic, or the back panel ACC jack, the rig will not fully initialize when it is powered up. It appears to be a failsafe mechanism to prevent someone from turning the rig on and transmitting accidentally. It's a good thing, but it can give you a scare the first time it happens to you!

Topic: 26900 Message: 26900

Hi all,
Tuesday evening our store was broken into. Our Yaesu FT897 with LDG AT897 two binatone PMR 446 have been stolen. If you could all keep an eye open for this combination coming up for sale please. It is unlikely the thieves know what they have got so i expect it will turn up on Ebay. also stolen was a PC uses to link the radio with HRD the interface was a G4ZLP USB multiface. The PC itself is machine i built out of spare parts so is basically untraceable. I am sure i have serial numbers somewhere and will post them if i find the safe place i put them in.

Hello Tom

Without knowing all the backgrounds of your problem suggesting you skip HRD and use just DM780 only. It works perfectly as such. You do not need the whole set up of HRD which to my mind is far too cumbersome and fat.

For CAT I am using Virtual Legacy Radio. Very nice and simple software.
Unfortunately it works with Yaesu only.

Ben

I wasn't looking to buy, but was just inquiring about the dust cover; sorry I wasn't more clear. I was wondering if you bought the dust cover, and if so, where? I have an 897D with the LDG-897 tuner attached. I would like to find a nice dust cover for mine, but haven't found one yet. I think a company could do well making custom dust covers for amateur rigs, especially nice ones with the radio logo's on them.

If anyone knows of someone making dust covers for ham rigs, please let me know. I posted this in the list instead of off-list because I thought others would be interested as well.

From: md3wsp
Topic: 26905 Message: 26905

Does anyone know/recommend where I can purchase an interfeace cable so that I can do the following at the same time:

1. Connect the FT-897D to the PC to use UcxLog.
2. Control a 3rd Party Linear (Need PTT Control from the Radio)
3. Have the ability to connect the radio to a SignaLink USB

I have looked around and there do seem to be a lot of cables but not sure what I need.

James

26906. Re: FT897d and ATAS 120a prob

Yahoo group: FT897 (2009)
Date: 2009-07-16 19:39:37 UTC
From: Rich
Topic: 26885 Message: 26906

Three things you need to do. 1) Have you specified how the FT-897 will use the antenna (HF or HF/UHF/VHF)? I forget the nomenclature used here 2) Have you turned it on? Once you have specified how the FT-897 will use the antenna there is menu item that you need to scroll to to turn it on. The correct menu item will have either TUNE or TUN just above A key. Press this key momentarily to turn it on. Then ATAS will appear in the upper right of the display.Tip here, if the word ATAS is in capital letters you are in the corrent portion of the band for amateur operation. If it is lowercase letters you are out of band for the antenna and it will not tune. 3) Onec ATAS is in the diplay then to tune the antenna to the frequency, press and hold the TUNE button for one or two seconds until tuning starts and then release it. ALSO make sure the mount or the base of the antenna has a good solid ground or it will not tune or motor up and down.

Hope this help, even a little.

I think you always have some rf in the shack.. If you go down the QRO route you suddenly start to discover just how much.
The secret is to radiate more of the RF you generate...

If you get your system working well at high power can guarantee it will work better on QRP...

Hello Paul

I cannot think of a fix off hand,,, But,,,
I notice you mention TX works OK, through your PC.

I wonder what [digi] mode you were last using, is there a possibility, you have inadvertently locked out the PTT control, somewhere using the digi software.
Try reading through your software control paperwork, and see can you find anything in that line. Read especially anything on "digital voice"
Best of luck with your problem.

DE N7UVL,
Depends on the size of battery; transmit use of
the rig; and utilization of a voltage regulator.
I wouldn't count on trying to start a car from it
after a few hours of use though./ga

Yes, dm480 works fine standalone. But I have to activate dig VOX to use it, and if I forget to turn it off, it messes with my headset. (Using preamp on dta port for headset mic). Plus I just wanted to see if it would work. :-)

Topic: 26909 Message: 26914

We've actually talked a lot about battery ops recently. Of you search the archive, you will find a recent thread that went pretty in-depth about it.

However, I do NOT recommend using a starter battery. The battery for your car is not made for this kind of use. Look for deep cycle sealed: gel cell, agm, or just a boat/rv battery. 50Amp hours could get you 2 hours or 20 hours.

Just a wild guess: If the Radio uses 1 amp receiving and 10 amps talking at 50 watts. So using that baseline, the radio uses 1Ah talking for 6 minutes. If you talk 50% of the time, that's 5Ah of talk a 1 Ah of listen per hour. Or 6 amp hours per hour. That gives an operating time of 9 hours on a 50 amp-hour battery.

I have seen RV batteries ranging from 50 to 200Ah. So you can do the math :-)

Not out of the box it won't, the powers that be in most countries won't allow it. It needs a hardware mod. Search this group, look at the files and check out www.mods.dk. You'll also need to think about how to tune your antenna as I don't know if the FC-30 or AT-897 will tune marine HF bands. Doubtless someone will be along in a moment to pontificate on the legality of it too. There's a lot to be said for buying a purpose made marine HF transceiver, not least that they're built for the conditions and will be easier to operate (not to mention ALE etc.) and mostly cheaper than the FT-897D. I'm guessing you know that but want a radio that will do amateur and marine in one box.

Whatever you do, make sure it's working to your requirements BEFORE you're out of VHF range from the shore. :-)

Subject: [FT897] CAT/Linear/Soundcard Interface.

Does anyone know/recommend where I can purchase an interfeace cable so that I can do the following at the same time:

1. Connect the FT-897D to the PC to use UcxLog.
2. Control a 3rd Party Linear (Need PTT Control from the Radio)
3. Have the ability to connect the radio to a SignaLink USB

I have looked around and there do seem to be a lot of cables but not sure what I need.

It would depend on the battery that you had in the car and its starting amps. I do know that mine lasted over an hour and a half because that is how long I was on my IC706 this afternoon at 100 watts sitting under a nice shade tree in my car with the breeze blowing on the top of a nice hill at 78 degrees a very low humidity. And it doesn't get any better than that. Hope that it helps you and did wonders for me.

26918. Re: car battery

Yahoo group: FT897 (2009)
Date: 2009-07-18 20:43:23 UTC
From: kav
Topic: 26909 Message: 26918

Hello

It depends on the battery, op mode and duty cycle.

The average UK car battery (as found cheap in the wide wheel and spark plug shops)is about 55Ahr. I used to get maybe 8 or ten hours running average 100w HF ssb doing a lot of tuning around, usually unsquelched and with a RX/TX ratio of maybe 20:1.

If anyone can tell you the spec of an '83 Camaro battery (coz I forgot), that one would give me about the same hours but for maybe two days instead of just one and by this time I was also feeding an auto tuner which took about another amp or more with every squeeze. So if you don't have one of those you may get longer.

Then I switched to a 110Ahr leisure battery (£35 then, £69.50 now). At 20:1 R/TX that would give me 12hrs plus for 3 days solid, sometimes up to five which I guess depended on the duty cycle. Then I stuck 4.8w of solar panel onto it which wouldn't go anywhere near to charging it but did slow down the discharge and gave me almost 8 days.

All of the above were mains charged, off the vehicle, (the biggy taking three days + with a naff charger) and then deep cycled.

That was then. I have just aquired some 75Ahr Optima Yellow Tops at, (if they work!), a rediculously good price. The AGM construction used means I am a little more confident about split charging it so may never run out of juice again. The first to be tested is on charge as we speak and the charger cost a tad more than one of the batteries. If I find they live up to the rediculous claims I will surely let you know.

I spoke to a chap at Optima UK who said they tested a Yellow 75 against a flooded 120Ahr deep cycle (at C20 rate?) and the Optima won by about 10% which equates to about an extra hour over ya small car battery and maybe and extra 3 to 4 hrs on the biggies. Personaly I'll believe that when I see it. Having said that, they are the same physical size so I think the 75Ahr rating on Optimas is just a bit of "badge engineering".

Anyway, you'll notice there is no science, or formula in the above just figures "as found". The other point I forgot to mention is that you can reduce all of the above by at least 10% until you figure out how to switch off the display backlight on your radio which really does make quite a diference. On the other hand you could double them for your situation as you're only running half the power.

Unfortunately choosing a suitable battery is not an easy task as it has to "fit" in so many ways. The optimas are great unless you're short of money. The big deep cycles are great unless you have a bad back. An ordinary car battery is great unless you wan't at least three days off the grid.

I hope you find what you're looking for.

Regards

Hi Folks,

Not beat the proverbial dead horse, but....

The ordinary 'car battery' is designed to provide very high current for very short times AND to never be deeply discharged. It will survive dozens of discharge cycles while deep cycle batteries will generally not provide the same high current / short time but will survive hundreds of discharge cycles.

If you anticipate using the battery frequently to operate a radio the car battery type is likely to fail rather quickly and will prove to be the most expensive solution over time as replacement intervals will be short.

Would have thought that, but my personal experience proved otherwise. First battery replacement
I ever bought for a Travel Trailer was a deep cycle Die Hard battery. Had to replace it the next
year. I replaced it with the cheapest car battery I could find and got 5 years out of it. Thirty years of Trailering later I've continued to use the same type of replacement batteries in my trailers and never got any less service from them. With my newest trailer I had to replace the original deep cycle battery after two years and the auto battery I replaced it with lasted 7 years. Now I've never done any wilderness camping and can see where those who do might benefit from the different battery. My battery simply furnished "in transit" power and backed up the trailer electric brakes if the trailer broke loose from the tow vehicle. (Never had that happen BTW).

26922. TNC's

Yahoo group: FT897 (2009)
Date: 2009-07-19 15:21:28 UTC
From: Ben Ramler
Topic: 22707 Message: 26922

Good morning Group,

I have a question on TNC's. I am sitting on a MFJ-1278 Multi-Mode Data Controller with Multi-gray Level Modem. Whats missing is the power cable and and all other cables? Can cables be had for this thing? I would like to use this TNC in my go kit for this like packet, APRS on VHF, and GTOR, PACTOR, PSK-31 this like that. This TNC should be able to do it souldn't it? It has dual ports in the back of the TNC for radio 1 and radio 2. It also has a jack in back for Speaker radio 1/2. It has a TTL Jack in back (not sure what that means).

I do have the software for it.

73,

Ben K0BLR

You should contact MFJ to see if they have a PDF file available
for you to download. If not ask around at a local ham club. I did
a search for the manual @ google & DXportal and had no luck. The 1278
does not support PSK as far as I know.

Hi Ben,
I have just uploaded the manual for your TNC to the files section.
The TTL interface you mention is a form of serial interface for older type computers dating to the days before we had PC's.
As far as modes like PSK and such you probably be better trying out something like Ham Radio Deluxe (HRD). The modes you mention were not around when your TNC was designed and these days nearly all data modes can be achieved via a pc sound card plugged direct to your FT897.

This was a workhorse of data controllers. Yes, you can get all connectors and make your own cables. And a USB to Serial interface will let you use it with your rig without any problems.

Also, if you are into RTTY, the best controller that mode is the PK-232MBX.
It will decode in some cases 100% of what no other TNC can even hear.

www.packet radio.com has a number of cables and wiring info too.

Soundcard RTTY is OK but a controller makes a world of difference. And there is still plenat of HF packet activity on 14.105LSB

thank you Wes! However I was talking with one EC who said that I am better off getting a true TNC to do modes like Winlink, PSK-31, BPSK, Packet, APRS, other modes like that. So I think I will just shelf this TNC and keep my eye on the ball and get a Kam-XL.

Hi Ben,
I have just uploaded the manual for your TNC to the files section.
The TTL interface you mention is a form of serial interface for older type computers dating to the days before we had PC's.
As far as modes like PSK and such you probably be better trying out something like Ham Radio Deluxe (HRD). The modes you mention were not around when your TNC was designed and these days nearly all data modes can be achieved via a pc sound card plugged direct to your FT897.

would this work you think. It has dual ports which is good. Plus they're based out of MN even Better.

This was a workhorse of data controllers. Yes, you can get all connectors and make your own cables. And a USB to Serial interface will let you use it with your rig without any problems.

Also, if you are into RTTY, the best controller that mode is the PK-232MBX.
It will decode in some cases 100% of what no other TNC can even hear.

www.packet radio.com has a number of cables and wiring info too.

Soundcard RTTY is OK but a controller makes a world of difference. And there is still plenat of HF packet activity on 14.105LSB

Harold,

I'm curious about a couple of things. The first is if your "in transit" usage was deep discharging the battery. If it wasn't draining the battery pretty low, it may not have significantly affected either battery, so the type of battery wouldn't have mattered much. The car batteries lasting five to seven years seems to be about their shelf life without significant use, if they are kept charged.

The second is if the trailer battery is in some way protected from supplying the towing vehicle with current during cranking. If there isn't some way of preventing this, including through the break system, then the higher draw while cranking the towing vehicle may have shortened the life of the deep cycle battery.

My trailer batteries never actually saw much use, in transit use was chiefly running the water pump or the 12v lights out on the road, usually during lunch stops. I never saw my trailer battery showing less than full charge during a tow. When overnighting I always used full hookup sites and the power converter in the trailer kept the battery generally fully charged. The tow truck battery furnished power to the trailer brakes thru a brake controller and he trailer battery would have acted on the brakes only if the trailer broke loose from the tow vehicle. There was a breakaway switch that, in the event of a trailer disconnect from the towing vehicle, would dump full trailer battery power into the braking circuit, hopefully stopping the runaway trailer quickly. When the trailer was parked at home I'd need to regularly check the battery and plug in the trailer so the converter would charge the battery if the power panel showed less than full charge. If I'd have been a wilderness camper the deep cycle batteries would probably have been a neccesity but the Missus liked her comfort so full hookup campsites were all we ever used.

That's why they died quickly; they were being constantly charged and never discharged. When you overcharge a battery, the energy has to go somewhere... In the case of an RV battery (which should have flat plates), it ends up boiling the electrolyte out of the battery. A big part of maintaining a deep cycle battery is *cycling* it. In your situation, you really do need a starter battery.

After doing some reading on battery science, I'm finding out that the way most people treat batteries destroys them prematurely. Part of that is ignorance and part of that is lousy equipment; it's no surprise, really, since nobody really talks about how to do it right, and most RV power converters don't have real smart charging circuits. (I'd almost rather disconnect the charging circuit and put a separate charger on the battery leads... I've actually seen that on some older trailers.)

What you need to do before investing in any type of storage battery is read up on the battery type first and find out the proper maintenance procedures. Some batteries can be left to charge with a float charger; others need to be cycled once in a while. Some others need to be stored with a 40% charge... the list of variations is endless, and consumer manuals are often dead wrong.

AGM, Gel-Cells, lead-acid (car/rv batteries), NiMh, NiCd, and Li-Ion batteries all require different maintenance and charging techniques, and even different types of lead-acid batteries can require different practices.

I am travelling, but if I remember correctly, there is a jumper in the radio to allow you to do that. I'm a little fuzzy on it, but you can get PTT. Look for J1027 on the main board. It is on the schematic of the radio as well.

Mike VA3MW

I searched and found this:

Re: AMPLIFIER with FT-897

Rod

I just got my 897 yesterday, and the first think I wanted to do was hook up the Acom amp to it. Having spent last night looking at the schematic (nice that they supplied them), I saw this jumper and wondered the same thing about J1027 (I also shared your thoughts as to way it was set up the way it was).

Just to save me a few less headaches, can you give me an idea on where on the board this was so I don't have to tear th entire radio apart?

73,

Mike VA3MW

Does anyone know/recommend where I can purchase an interfeace cable so that
I can do the following at the same time:

1. Connect the FT-897D to the PC to use UcxLog.
2. Control a 3rd Party Linear (Need PTT Control from the Radio)
3. Have the ability to connect the radio to a SignaLink USB

I have looked around and there do seem to be a lot of cables but not sure
what I need.

To do any of the digital modes, all you need is 12v power (standard'ish' cannon connector).

Then Audio out from the radio to audio in to the TNC

Audio out from the radio to audio in to the radio (mic or data)

Ground

PTT

It won't do PSK. That you'll have to do with your computer (like HRD, etc.).

Just google that MFJ unit.

PTT should be available on the CAT connector... someone recently talked
about building a breakout cable that pulled the PTT out in to its own line..
.I can't remember if that was here or on QRZ.com

In regards to batteries for mobile use.

I use one of the portable car jump start packages for my FT897D, so far I used the battery for 3 years at least 35 hours each week. I noticed no recognizable degradation of the capacity. The radio is used mainly in the HF SSB mode, the time of operation between recharges is generally between 4 to 6 hours. This is at full 100 watt power output in SSB mode. The battery is a 650 Amp Start current battery with an internal 12 Amp/hour Gel Cell. As I said it works OK for the last 3 years in constant use. Now I can not understand that a normal type starter battery, which after all has usually 55 Amp/Hour rating can not at least have a 3 or 4 times higher life between re-charges. I do it this way to stop getting stranded with a discharged car battery.

Incidentally I had to use the Jump Start package yesterday as I forgot the parking lights. She still started the car OK after 3 years heavy use.

Some more info . Most modern cars use car computers which drain the standard car battery after a reasonable short unused time, like a week or 10 days. If it is correct that the batteries do not like too many charge/discharge cycles they would not at all last even one year in a modern car. So that reasoning can not be too correct.

I believe there is a difference between discharge and deep discharge. If the computer deep discharged the battery, it would not start the car. It must stop discharging at a voltage much higher than what would be considered a completely discharged battery.

26939. RE: [FT897] Re: car battery

Yahoo group: FT897 (2009)
Date: 2009-07-20 07:03:48 UTC
From: Dr Mark Vaughan
Topic: 26909 Message: 26939

If you are going to run one of these radio's from a lead acid battery, you'll find as the battery discharges the radio will stop working long before the battery is in trouble, based on my work with 857's, which is virtually the same radio they'll stop at around 10.8 to 11.2V either by the radio falling over, or your contact telling you your signal has gone really bad, the 857's start to throw out nasty harmonics before they stop.

The trouble threshold for a lead acid battery of any type is around 9V, below this some batteries suffer, deep discharge ones suffer less. If you've dropped one below

This either special charging methods are needed, or use a normal battery charger and put 240R in series with the battery to limit the current which would otherwise be hi and damage the battery. In theory from 9V up you can push a lot of current into the battery for a while until a certain rate of change of current if reached with respect to the battery temperature. This is more critical with gel batteries, than liquid, and a function controlled within the battery charger chips you'll find in SLB 3 and 5 state chargers. Though the chip sits in the charger next to its transformer measuring the transformer temperature rather than the battery temperature. Once this tamper region is met, you float the remaining charge in with a 13.8V regulated output.

As you can see with the radio by the time the radio stops working you haven't dropped much charge from the radio, and a standard 13.8V supply is usually good enough to pull the battery back up again without much life issues.

These techniques work for all lead acid liquid or gel batteries. There are some other techniques for recovering damaged cells but success and battery types then get complex but you shouldn't find yourself needing these.

One thing to beware of, with the 857, if you leave it turned on and let it run a battery down, as the battery voltage drops you get to a point where you cannot turn the radio off, it looks from the display as though it's off but continues to try to pull a large amount of current totally flattening the battery. If you are going to leave one unattended, get one of those battery drain sensing relays that disconnect the battery when the voltage drops below 11V.

Probably the main reason that you had that experience is that the car batteries have much more sturdy plates as they are designed to withstand the vibration in a moving vehicle.

The deep cycle batteries are normally designed to be used for off grid supply where they sit in the one place all the time and aren't moved about all the time and have much thinner plates which just get shaken to bits when they are in a vibration environment such as a vehicle.

Would have thought that, but my personal experience proved otherwise. First battery replacement
I ever bought for a Travel Trailer was a deep cycle Die Hard battery. Had to

replace it the next
year. I replaced it with the cheapest car battery I could find and got 5 years out of it. Thirty years of Trailering later I've continued to use the same type of replacement batteries in my trailers and never got any less service from them. With my newest trailer I had to replace the original deep

cycle battery after two years and the auto battery I replaced it with lasted

7 years. Now I've never done any wilderness camping and can see where those who do might benefit from the different battery. My battery simply furnished

"in transit" power and backed up the trailer electric brakes if the trailer broke loose from the tow vehicle. (Never had that happen BTW).

In ARRL's book "Emergency Power," in the chapter "Holding your Volts: Battery Systems and Storage," author Michael Bryce WB8VGE writes just the opposite. He writes that an automobile battery has many thin plates in order to provide high starting current; the more current you want, the more plate surface area you need. Conversely, a deep-cycle battery has relatively few plates, and they are thicker and more rigid.

26944. ATAS-120 or Alpha Delta DX EE antenna in attic?

Yahoo group: FT897 (2009)
Date: 2009-07-19 18:57:52 UTC
From: tennesseephil
Topic: 26944 Message: 26944

I passed my technician and general exams yesterday, so I am shopping for equipment today. I've pretty well settled on the FT-897D, but I'm having difficulty deciding on an antenna.

For a number of reasons, it would be more convenient for me to install an antenna in the attic rather than outside. Two possibilities I am considering are: (1) an ATAS-120 with a sheet metal plate under it to provide a ground plane, or (2) an Alpha Delta DX EE antenna along with a LDG AT-897 tuner.

Do you think the ATAS-120 would work well in an attic? I have enough vertical clearance. If I do this, what size sheet metal ground plane do I need under it, and what would be the best choice of material? Should I use real sheet metal, or would chicken wire mesh work?

What is the total length of the Alpha Delta DX EE? Will it work for 2 meters and 440, or will I need a separate antenna for those bands?

You have it backwards. Deep cycle batteries have MUCH thicker plates. The positive plates in some are as thick as a quarter inch where car batteries are only a few thousandths. In fact, car batteries typically don't even have solid plate - they are made of lead sponge. True deep cycle battery plates are solid.

Phil,

Congrats on getting licensed! Welcome aboard.

Antennas are easy to build, and a homebuilt dipole is one of the best antennas. They are trivial to make yourself.

Having said that, if you want to purchase, the Alpha Delta antennas are high quality. They are "fan dipoles". You can also build them yourself if you like.

You will want a seperate 2m/440 antenna. These can be purchased or home-brewed. Arrow Antenna makes very good VHF antennas. http://arrowantennas.com/
See the OSJ 146/440 j-pole.

If your antennas are resonant on the frequencies of interest, you should not need a tuner. If you get a non-resonant antenna (like the G5RV), you will want the tuner. The DX-EE should be resonant on the bands it is designed for.

An antenna analyzer might be a better investment, depending on the types of antennas you use.

For UHF/VHF, you really don't want an attic antenna if you can help it.

I use a simple Radio Shack ground plane antenna for 2 meters. You can also use it on 440, but the radiation pattern sends the signal pretty high; some people have better results than others. The radiator is only about 20" long, so it's not hideously ugly outside the house. If you are really trying to hide an antenna from the HOA or whatever, you could either stick it in a tree or even make a small wire antenna and place it in a window... with UHF and VHF, the primary consideration is a clear view toward the repeaters you'll be working.

Since you're a technician, you'll probably most actively work 10 meters. You can only work CW (not any of the other data modes) in the data segments of 10, 15, 40, and 80 meters. Realistically, unless you're really trying to learn morse code, you'll probably want to set up an antenna to work 10... again, inside the house, you won't get the kind of signal you'll get outside... but the same rule applies to any length antenna...

The Alpha Delta will probably work fine in the bands its tuned for, but no matter what, putting it inside the house is going to hammer your signal. If there's any way at all you can get it outside, you'll get better performance than the attic... even attaching it under the eaves in the back yard is better than mounting it indoors.

Yes, an analyzer is pretty much an essential element in the shack... I wouldn't even try to cut a dipole without an analyzer, dip meter, or even a noise bridge (I did use a noise bridge to build an antenna; it's a lot more work than an analyzer, but it was only about $20...)

The good thing about installing an antenna(s) in the attic is that it is immune to lightning and the weather. Install it, tune it, and forget it.

The bad thing about installing an antenna in the attic is that when you transmit, you will be received throughout the house on the security system, cable tv, intercom, and telephones if your house is like mine with all these cables running from room to room via the attic!!

Good luck!

Frank K6FCW

HI,

I have a Ft-897D and love it. Nice little radio in a very small package. As far as antennas go and since you just got your technician, I'd homebrew some antennas (to keep costs down) for a few of the bands that you are licensed for. A inexpensive dipole for 10m would work okay. You could put it inside if you wanted but outside would be better. Here's a link to a super easy to build 10m dipole.
http://www.hamuniverse.com/10metertechniciandipole.html

Since you also mentioned 2m and 70cm I would build a cheap yagi for those bands. You can make them for FM or for SSB and they are really very easy to make. Especially the 70cm version as you don't have to do any splicing if you use 1/8" brass welding rod for the elements.
http://www.wa5vjb.com/references.html

Then when you decide to upgrade. You will upgrade won't you? J You can add more wires to the 10m dipole and convert it into a fan dipole which will allow you to get on some of the other bands you would be licensed for at that point.

I used it in an upstairs bedroom, by attaching it to a bed frame. It worked, but not as well as the 80 meter dipole wire antenna, that I attached to my house gutters with those clips that hold up holiday decorations to the gutters and eves. I wrapped the 40 meters or wire around the house on three sides, and fed it 14 percent off center using a 4 to 1 balun. It works on 80, 40, 20m 15 and 10 meters. Cost me less than $50 to build and install and the wire is hard to see from the road, so the neighbors don't complain. From the Detroit area, I've worked the east coast, and the west coast, even Hawaii and south America too.

From: dug b
Topic: 26883 Message: 26956

Just wondering if anyone on the list had purchased a dinkey for use with their 897. It looks like it should work pretty well as a portable paddle and I was thinking of ordering one; just wanted to see if there were any users who had an opinion. If you haven't seen what I'm talking about it's a tiny cw paddle that plugs directly into the mike jack of the ft817 or ft897. Check http://www.geocities.com/micro-wave/dinkey.html for details.

Everyone seems to miss the other points about home-brewing the antennas. Not only does it keep the cost down, but you are building a more efficient antenna for the band you wish to work. Most (if not all) commercially made antennas are mfd for multiple uses, not just amateur.

These broad-banded antennas will work for our needs but you will almost always need a tuner to get it to work. I make mine so that I get the best readings in the middle of the bands I use so as I tune either direction from where the antenna is tuned the swr and what not do not change much.

Finally, it gives you experience in fabricating the antenna, gets you thinking about antenna design, as well as the feeling of accomplishment that YOU were able to make something and get it to work CORRECTLY! That is such a rush!

Subject: [FT897] ATAS-120 or Alpha Delta DX EE antenna in attic?

I passed my technician and general exams yesterday, so I am shopping for
equipment today. I've pretty well settled on the FT-897D, but I'm having
difficulty deciding on an antenna.

For a number of reasons, it would be more convenient for me to install an
antenna in the attic rather than outside. Two possibilities I am considering
are: (1) an ATAS-120 with a sheet metal plate under it to provide a ground
plane, or (2) an Alpha Delta DX EE antenna along with a LDG AT-897 tuner.

Do you think the ATAS-120 would work well in an attic? I have enough
vertical clearance. If I do this, what size sheet metal ground plane do I
need under it, and what would be the best choice of material? Should I use
real sheet metal, or would chicken wire mesh work?

What is the total length of the Alpha Delta DX EE? Will it work for 2 meters
and 440, or will I need a separate antenna for those bands?

I use a "Battery Tender" (http://www.batterytender.com) to maintain the long-term charge on batteries such as my generator starter battery. The Battery Tender has a controller that monitors the battery voltage and prevents overcharging. I think it also is smart enough to do some intentional voltage cycling which helps the life of batteries. Their "Plus" version monitors ambient temperature and adjusts the voltage it holds the batteries at based on room temperature.

26962. Rig's SWR Meter

Yahoo group: FT897 (2009)
Date: 2009-07-22 13:16:15 UTC
From: Ed Metzler
Topic: 26962 Message: 26962

I posted this question a couple of days ago, then decided I needed to do more of my own research, because there has to be something simple I'm missing. But I haven't found the answer, even talking to a couple of hams who have 857s.
The problem is the SWR meter on the 897D doesn't react at all when I'm on the HF bands (unless I'm talking into the mike). When I'm in FM mode on the VHF bands it works fine.
Here is what I am doing: I have my rig hooked up to a Buddistick. The stick is about 9 feet off the ground. Per the manufacturer's instructions, I have the counterpoise wound out about 31 feet and elevated off the ground about 4 feet. I can hear very well on 40 meters, and I've made a couple of contacts. But when I try to check my SWR, the meter doesn't move when I key the mike without speaking. I've put it in CW mode to get a constant carrier and keyed the mike, but the needle still doesn't move. And I'm not getting an HSWR warning. I bought a Radio Shack SWR meter and have exactly the same problem. I can't even calibrate it. I've been told to turn my mike gain to 0, and others said to jack it way up. Neither had any effect, so I've put it back to the default, 50. One person suggested I increase my carrier signal, but I'm not sure how to do that. I know I must be missing something simple, but for the life of me I don't know what it is. This isn't my first HF rig, but it's the first time I've had this problem. I'd really appreciate your help.

It looks like it should work pretty well as a portable paddle and I was thinking of ordering one; just wanted to see if there were any users who had an opinion. If you haven't seen what I'm talking about it's a tiny cw paddle that plugs directly into the mike jack of the ft817 or ft897. Check http://www.geocities.com/micro-wave/dinkey.html for details.
>
> 73 de KC4RSL

Yes, I bought one about two years ago and works fine. I had to file the stops a little in order for the key to lock. The builder told me he would need to reset the stops placement for future ft-897 dinkeys because of the recurring problem. I'm sure this is resolved now but you might ask about it if you consider getting one.

>Ed/KC9HSY

Because on SSB there is no RF output unless you are talking. Use AM or CW
to test SWR. Pretty sure you need a key in the key jack for cw output.

The fundamental problem seems to be that you don't understand the difference between each mode.

With USB and LSB, your radio's power output is directly proportional to your audio level. When no audio is hitting the mic, the transmitter is basically not doing anything. SWR meters measure the amount of energy coming back from the antenna, so if the radio's not sending anything, there's nothing to measure.

If you don't have a CW key plugged in to your rig, and you don't have a switch plugged in to the ACC port, you need to put the radio in AM mode, set your RF power as low as it goes, and key the mic. ID first, then just hold the PTT button while you calibrate your meter. Once it's calibrated, you can flip the switch to SWR and read the SWR off the meter.

When you're done, turn the power back up and flip back to USB or LSB.

If you're using a tuner, you might consider getting or building the "one touch tuning" circuit that someone else talked about in a previous post. It's very simple, and it makes tuning a lot easier.

You can also make the rig transmit a constant carrier through the key port, the ACC port (the ring, not the tip), or the PTT line on the data port. The data port sends a carrier in CW mode or any time when Auto CW is turned on.

Forgive me if I am stating the obvious here, but you do realise that USB and LSB only have an output when you talk don't you? If you don't speak (or make a noise) then the radio won't have an output. Try FM or AM. For CW I'm sure you need a key in the jack.

Paul.

26968. Re: [FT897] Rig's SWR Meter

Yahoo group: FT897 (2009)
Date: 2009-07-22 21:21:00 UTC
From: P Grant
Topic: 26962 Message: 26968

Hello Ed,

Forget about what antenna you have in use for HF.

The problem you are having is using and understanding the readings on the 897 , built in SWR Meter !

To start,,, buy or borrow a 50 ohm dummy load.,,, 25 watt is well good enough for use on any of the bands, you will only be using low power for testing. $5 - 10,,,

You mentioned having purchased an SWR meter , if it is good for VHF, it is good for HF also, but not always vice -versa.

Connect the radio, SWR Meter, and dummy load together with short jumper coax cables.

Go to Menu 75, and select say 10 watts. select FM mode on say 7.1 MHz ???

Press the microphone PTT,,, the needle on the forward power reading on the SWR meter will read 10 watts [or very near.] Try this on all bands same result !!!
Whatever power you set on menu 75 will show on the SWR meter as the forward power.

THIS IS ONLY ON FM,,, OR AM.
Not on SSB. To have a reading on the meter with SSB, you must "awaken" the carrier !... whistle in to the mike,,, the needle will kick up !!! same thing with a long "AAAAAAAAH."

The radio is working 100%.

Just my own idea,,, but I do not recon with readings on the "in box" SWR meter,,, I think it's just a decoration, the "HISWR", is on the other hand a first class option.

So now you have the basic idea of understanding how your radio performs with TX power, you can experiment with tuning your "buddipole" using the SWR meter,,, you will do this in FM mode !!!, and on low power [change the dummy load for the antenna, and you are ready to make adjustments to the buddipole. The SWR meter will, when you have a poor SWR reading, show this as "reflected power" as compared to "forward power"

The ratio between Forward power and reflected power is the "SWR Ratio"

{for example,,, forward power = 20 Watts... reflected power = 10 watts,,, SWR - 2:1 }

You will get much better settings than that, hopefully 1.2 : 1,,, all the time...

There are many other posts in the achieves of both the "buddipole" , and "FT897" yahoo groups,, which you should read back over to find many similar questions and answers !"

I don't need to wish you luck,,, so I'll wish you good DX,,

Have Fun

Another way to produce a low-power carrier for tuning or testing purposes is to use a built-in feature of the FT-897 ACC jack. It is a 3-connector 3.5 mm "mini-stereo" type jack. The tip connects to the ALC circuit, and application of a negative voltage to that contact will reduce the transmitter output. An input of minus 4.0VDC will reduce transmitter power output to zero. The middle ring on the jack, when shorted to ground, keys the transmitter.

See page 20 of the OpManual, which says, in part:

ACC Jack
This 3.5-mm 3-pin jack accepts external ALC (Automatic Level Control) voltage from a linear amplifier on the tip connection, and accepts a “Transmit Request” command on the ring connection. The main shaft is the ground re- turn. The “TX Request” connection, when shorted to ground, puts the FT-897 into the transmit mode, and sends out a steady CW carrier, for linear amplifier or manual anenna tuner adjustment.

One member of this group, DF1QQ, has posted a circuit diagram in the FILES section of the group's space on Yahoo, http://groups.yahoo.com/group/FT897/files/ , under the heading "DF1QQ_tuning_box version2_for_ft_897.gif". This device applies a negative voltage to the tip of the 3-pin jack, and simultaneously shorts the middle ring to ground (the main shaft), resulting in the rig transmitting in CW mode at a power output controlled by the potentiometer setting on the Tuning Box.

I and others in the group have built and use this device; it works fine. I built a a slightly modified version of this project that DF1QQ described. It is important that you don't plug the device into the ACC Jack while there is negative voltage applied to the jack tip (that is, the device is turned on). To protect against that possibility, I built my Tuning Box with a momentary-on switch, and also added an LED that is lit whenever the device is turned on. Additionally, I changed the resistor configuration so that I have 14KΩ of resistance "above" the 10KΩ potentiometer, and no resistance "below" it. This modifies the output of the voltage divider, and means (assuming a 9.5 volt output from a fresh 9 VDC battery) that the output to the tip of the jack will be at a maximum of 10/24 x -9.5 = - 3.96 volts , which will force the transmitter output power down to about zero, and at a minimum will reduce the ALC will be close to zero volts, leaving the transmitter at whatever power level is set by menu. Just make very sure that you have the plug inserted all the way into the jack before you turn it on, and you'll be OK. (The circuit proposed by DF1QQ, with a fixed 10K resistor, 10K pot, and another 10K

resistor in series, creates a voltage divider that will provide a negative voltage ranging from 3.17 to 6.33 volts. At one extreme, this will reduce transmitter power to about 25% of "normal, and the other extreme provides -2.33 volts more volts than is required to drive transmit power to zero. I think my voltage divider configuration is more appropriate.

Another school of thought finds the risk of frying your CPU unacceptable, In an earlier posting, Geert Jan PE1HGZ) commented:

"I'm not too keen on this. The negative voltage is on the tip. If the plug isn't pushed in fully, then the negative voltage goes to the middle ring (not ground ring) connector of the ACC plug, which is the PTT pin of the ACC plug. The PTT line directly goes to the main CPU (with some buffer resistors, but that's it). Hence, if the plug isn't in in full, then you will inject a negative input voltage on the CPU pin. This is a recipe for destroying CMOS circuits, in this case, the CPU."

He has described an alternative solution to the same problem, a small circuit modification that fools the FT-897 into thinking it is running on batteries, and thus reduces transmitter output to 20 watts. His mod is described in the Files section under the heading "PE1HZG high SWR protection."

To each his own taste, but I went with DF1QQ's approach because the circuit board modification requires working amongst very small components. If your rig's under warranty, it would probably void the warranty, as well.

Meanwhile, as others have noted, you're never going to get any SWR when in SSB mode unless you talk or whistle into the mike, because no modulation means no power output, and with no power output you won't see any SWR reading.

No, the problem he is having is he is forgetting there is no carrier in SSB when he keys the mic. He forgot that to get a carrier, he needs to be in AM, FM or CW mode. If you read his original post, he even stated that the only time the SWR meter moved was when he spoke into the mic.

Do you have a tuner on your radio? First of all when you are either USB or LSB on the radio, you have no output into the radio and the antenna until you speak, therefore you have no SWR reading. Try tuning the radio either with a CW tone or in AM until you get your SWR down. Then it should be okay when you transmit on SSB.

From: eric@van-de-weyer.org
Topic: 26962 Message: 26972

Of course, one ofthe simplest ways is to go to AM mode and hit the PTT. You will have a carrier of about 1/4 of the full setting so, if the rig is set to 100% then the carrier on AM will be about 25W.

26973. Re: [FT897] Rig's SWR Meter SEE ORIGINAL POST !!!

Yahoo group: FT897 (2009)
Date: 2009-07-22 23:09:19 UTC
From: P Grant
Topic: 26973 Message: 26973

Read some of the advise he got before posting here in his original post !!!

Hello again Ed,

I hope all this advice has helped you understand the facts relating to "no output " showing on the meter when you PTT using SSB.
As you already told us, there is power on PTT on VHF, I presume FM,,,,

Just a small reminder,,, when you are transmitting a signal through your "buddipole", to help with tuning,,,, DO NOT USE CW MODE,,, use FM only...

There are far too many thoughtless users tuning on CW, ,,, this is transmitting a tone on the frequency while you are making your adjustments... Yes readers,,, that is why you can hear constant blasts of "tone", all over the bands,,, not so common, or not as long as used to be,,, a lot of users now have "auto tuners" which only transmit tone for 2 - 5 seconds,,, but still enough to loose that special rare QSO. You can hear lots of idiots tuning on the band, any time there is a pile up,, and these are the people who criticise others for not knowing everything.

Enough said Ed,,, use FM, mode for the short transmissions, when "tuning " your Buddipole on the HF bands,,, when you get familiar with tuning up the "Buddipole", you will laugh at those who cannot use an SWR meter,,, and spend hundreds of $$$ on Antennalisers !!!

Hope to work you soon

Subject: [FT897] Rig's SWR Meter

I posted this question a couple of days ago, then decided I needed to do more of my own research, because there has to be something simple I'm missing. But I haven't found the answer, even talking to a couple of hams who have 857s.

The problem is the SWR meter on the 897D doesn't react at all when I'm on the HF bands (unless I'm talking into the mike). When I'm in FM mode on the VHF bands it works fine. Here is what I am doing: I have my rig hooked up to a Buddistick. The stick is about 9 feet off the ground. Per the manufacturer' s instructions, I have the counterpoise wound out about 31 feet and elevated off the ground about 4 feet. I can hear very well on 40 meters, and I've made a couple of contacts. But when I try to check my SWR, the meter doesn't move when I key the mike without speaking. I've put it in CW mode to get a constant carrier and keyed the mike, but the needle still doesn't move. And I'm not getting an HSWR warning. I bought a Radio Shack SWR meter and have exactly the same problem. I can't even calibrate it. I've been told to turn my mike gain to 0, and others said to jack it way up. Neither had any effect, so I've put it back to the default, 50. One person
suggested I increase my carrier signal, but I'm not sure how to do that. I know I must be missing something simple, but for the life of me I don't know what it is. This isn't my first HF rig, but it's the first time I've had this problem. I'd really appreciate your help.

Hello Ed,

Speaking of the obvious, I climbed a 200 metre 'hill' one day with my 187, a battery, a 5 element SOTA beam and a fiberglass telescopic pole. I was more than ready for a good rest by the time I got there! I got everything set up, and tuned around 2m wondering why it was so quiet on there. After about 20 minutes of calling CQ on 2m I realised I had the beam pluged into the front BNC, but VHF was set up to use the rear socket!

I think we all miss the obvious at times :)

Hello Peter,

Just out of interest, who told you that tuning on FM doesn't interfere with SSB? Or are you not saying that? Have you ever tuned through VHF on USB and listen to the whistles created from stations transmitting on FM? I use FM to tune, simply because it's convenient (and I don't have a key). I did miss the obvious one though (THANKS ERIC!), tune on AM. As I'm only allowed 50 watts (2E0) AM drops off to about 12 watts. Its going to save me quite a bit of button pushing :)

Paul.

And I'm not getting an HSWR warning. I bought a Radio Shack SWR meter and have exactly the same problem. I can't even calibrate it. I've been told to turn my mike gain to 0, and others said to jack it way up. Neither had any effect, so I've put it back to the default, 50. One person
suggested I increase my carrier signal, but I'm not sure how to do that. I know I must be missing something simple, but for the life of me I don't know what it is. This isn't my first HF rig, but it's the first time I've had this problem. I'd really appreciate your help.

If you are using the MH-31 or MH-59 microphone you can set it up to send CW via the menus (I suspect the MH-36 mic will work as well). I believe the menu selection is "CW PADDLE": selections from this menu are "ELEKEY" & "MICKEY". Select MICKEY. UP button sends dits...DOWN button sends dahs...or you can reverse it via another menu selection.

Thank you for your message. I continue to hear good things about the FT-897 from many sources. I'm trying to find a local ham with an 897 who I can visit.

As I said in my original post, I passed my Technician AND GENERAL exams last Saturday. I have already started studying for the Extra Class, and I plan to take that exam in September.

Hello Paul

As regarding tuning on FM, I was always taught that that was the thing to do !

I would have replied an hour earlier, but I wanted to see if I could back up my suggestion. I telephoned a friend, who lives about 2 Miles away from me.

We ran an experiment, he transmitted 5 watts FM into his 40 M, Buddistick, to simulate tuning on 7.105 MhZ, ,, We tried several attempts, and although we are only 2 miles apart there was no sign of audio interference while listening on HF.

We were using 145.200 FM as a talk channel, on 5 watts.

Just to be sure, we repeated a test while tuned to a strong local HF station which was transmitting on 7.068 MHz, in this case I could not detect any s meter action, as compared to when on FM mode on a clear channel, neither was there any "noise", while testing on SSB on a clear channel.

I am 100% sure that there is an alternative to my way of thinking, and am always prepared to learn something new.

I do not own a "Buddipole or Buddistick", antenna system, but am impressed at the construction, and versatility of the product.

By the way,,, My friend was using the Vertical buddistick, when doing the test transmission, and I was using a 40M horizontal di pole.

With regard to "all the button pushing",,,,, to tune up the buddistick, after some practice you will find you can reduce the number of PTT's needed to set up to resonance on the various bands you use.

Another complaint I have heard is the "menu" setting changes needed using the 897,
I have blocked out all the settings which I do not use. Out of the 90+ menu settings, I only use 8. Of these I set in memory the readings which I use most frequently.

I am using my 897 more and more as my base rig, as I find it quite easy to operate, I also have the FT857, which I intended to use .Mobile, but never actually got around to setting up mobile antennas correctly. So I am using VHF only in this car. It's a Peugeot 407 estate with the full glass roof, ,,, there is just enough roof at the back, for a triple mag-mount, and tuning a 80 M, Pro-Am needs a lot more metal than I have available.

My "Big" radio for the shack, is the FT 767 GX, which although old, is all I can ask for. It has no DSP, but it does have an equally good CAT system, which I use on Digi modes a lot.

I am not a buddipole "user", and therefore probably do not qualify to answer questions on this forum, at all !!

Paul, I have just re read your post ,,, No,,, I have never tuned through VHF on SSB, and heard anything unusual, but I will try to do that during a VHF contest when there are plenty of stations working. As I said, I was always told to use FM for tuning, so I did the experiment earlier. I will also admit that there may be a vast difference between HF, and VHF, in this case.

My final comment is that up until today, I would have lost any bet, regarding the FT897, sending a carrier on CW, via the PTT, unlike some older radios. It does not !!!

We live and learn,, me included.... Jack of all trades, and a master of ONE.

Best 73 _____ Peter EI4HX ei4hxperimental@...

Hello Peter,

Just out of interest, who told you that tuning on FM doesn't interfere with SSB? Or are you not saying that? Have you ever tuned through VHF on USB and listen to the whistles created from stations transmitting on FM? I use FM to tune, simply because it's convenient (and I don't have a key). I did miss the obvious one though (THANKS ERIC!), tune on AM. As I'm only allowed 50 watts (2E0) AM drops off to about 12 watts. Its going to save me quite a bit of button pushing :)

Paul.

Read some of the advise he got before posting here in his original post !!!

Hello again Ed,

I hope all this advice has helped you understand the facts relating to "no output " showing on the meter when you PTT using SSB.
As you already told us, there is power on PTT on VHF, I presume FM,,,,

Just a small reminder,,, when you are transmitting a signal through your "buddipole", to help with tuning,,,, DO NOT USE CW MODE,,, use FM only...

There are far too many thoughtless users tuning on CW, ,,, this is transmitting a tone on the frequency while you are making your adjustments. .. Yes readers,,, that is why you can hear constant blasts of "tone", all over the bands,,, not so common, or not as long as used to be,,, a lot of users now have "auto tuners" which only transmit tone for 2 - 5 seconds,,, but still enough to loose that special rare QSO. You can hear lots of idiots tuning on the band, any time there is a pile up,, and these are the people who criticise others for not knowing everything.

Enough said Ed,,, use FM, mode for the short transmissions, when "tuning " your Buddipole on the HF bands,,, when you get familiar with tuning up the "Buddipole", you will laugh at those who cannot use an SWR meter,,, and spend hundreds of $$$ on Antennalisers !!!

Hope to work you soon

I've got some concerns with the basics of this question.

FM, CW or AM. All produce a constant carrier. You can measure swr with any of them with FM and CW normally being the same power.

But, I have to ask. Was the differences between these carrier modes (A1, F1 and A3) not taught in the classes you had to take in the Amateur classes and also part of the test for the amateur radio certificate and how each related to the power output from your transmitter?

I am not targeting the person who had the original post at all. But, I am targeting the education process. This is a very basic question that each and every amateur needs to understand 100%.

Do you have a tuner on your radio? >> snip<< Try tuning the radio either with a CW tone or in AM until you get your SWR down. Then it should be okay when you transmit on SSB.

Subject: [FT897] Rig's SWR Meter

I posted this question a couple of days ago, then decided I needed to do more of my own research, because there has to be something simple I'm missing. But I haven't found the answer, even talking to a couple of hams who have 857s.
The problem is the SWR meter on the 897D doesn't react at all when I'm on the HF bands (unless I'm talking into the mike). When I'm in FM mode on the VHF bands it works fine. Here is what I am doing: I have my rig hooked up to a Buddistick. The stick is about 9 feet off the ground. Per the manufacturer' s instructions, I have the counterpoise wound out about 31 feet and elevated off the ground about 4 feet. I can hear very well on 40 meters, and I've made a couple of contacts. But when I try to check my SWR, the meter doesn't move when I key the mike without speaking. I've put it in CW mode to get a constant carrier and keyed the mike, but the needle still

doesn't move. And I'm not getting an HSWR warning. I bought a Radio Shack SWR meter and have exactly the same problem. I can't even calibrate it. I've been told to turn my mike gain to 0, and others said to jack it way up. Neither had any effect, so I've put it back to the default, 50. One person suggested I increase my carrier signal, but I'm not sure how to do that. I know I must be missing something simple, but for the life of me I don't know what it is. This isn't my first HF rig, but it's the first time I've had this problem. I'd really appreciate your help.

A1 or CW, the modulation is conveyed by transmitting either a full carrier (key down) or no carrier (key up).

A3 or AM, the modulation is conveyed by transmitted by varying the carrier amplitude to represent the audio signal. Typically, the higher the positive amplitude of the modulating signal, the higher the carrier level, the higher the negative amplitude, the lower the carrier level. Because of this, normally the resting carrier level (no modulation) is at half the peak carrier level in terms of voltage.

In the case of AM, the percentage (depth of) mosulation can vary between perhaps 30% on some broadast services to close to 100% for communication services.

F3 or FM, the modulation is conveyed by varying the frequency of the carrier. Typically, the higher the positive amplitude of the modulating signal, the higher the carrier frequency, the higher the negative amplitude, the lower the carrier frequency. With no modulation, the carrier frequency is at the nominal frequency.

In the case of F3, the movement (deviation) of the carrier frequency for audio cen be between perhaps 3kHz for communication to as much as 100kHz for broadcast audio.

I would have thought that all licenced amateurs should know this.

Geoff

From: Ed Metzler
Topic: 26973 Message: 26984

I received my license several years ago, and shortly after moved into a covenant restricted subdivision, so I spent only a few months on radio. I am just now getting back to it.
But more to your question about the education process, I think it leaves something to be desired. So much of the emphasis is on learning answers to the questions in the pool, and, based on my own experience, very little on making sure you really understand the principles. I did take a class for Technician, but really could have passed just using the books that explain answers to the pool questions.
You could argue that if you learn the answers to the pool questions then you have learned quite a bit, and that may be true, but I think the approach could be more geared to learning, then testing to see what you've learned.
I wasn't a technician very long before I passed my General test and the code test. I'm sure I learned a lot during that process, but I've forgotten much of what I learned. Thus, my question.
But it seems that at least one other person on this group agreed that you don't have a carrier unless you either are in CW mode or talking into the microphone, so perhaps my situation isn't unique. And the hams I asked in my community (three of them) didn't understand why it didn't work, either. I do feel like my knowledge of radio is woefully inadequate, but I'm not sure that is an indictment of the system. But the folks on this group really seem to know their way around the hobby. As a guy who learned everything he knows about radio, wave propagation and electronics from the technician and general books, I am quite amazed by your knowledge. And, I very much appreciate your taking the time to answer my question.

I think you'd surprised at the amatuers who wouldn't understand your answer. A lot of people get their tech license to get off of CB and on to 2 meters, which is beginning to sound a lot like CB, unfortunately. I don't mean to paint my own community with a broad brush, because there are a lot of very knowledgeable hams out there. But I think there are many who just did what it took to get a tech license, and you can do that without learning all the ins and outs. And if you never have any intentions of getting your General ticket and into HF, it doesn't take long to forget what you've learned. You buy a mobile rig, buy an antenna and you're on the air. Doesn't take much to do that.

Topic: 26973 Message: 26986

Hi Ed

Thanks, and I am bringing this forward not to single you out and I am glad you asked the question. You are now much wiser. What scares me is those that don't ask the question. J

I was pretty sure of the answer you were going to bring forward.

73 and good dx.

Subject: [FT897] Re: Rig's SWR Meter SEE ORIGINAL POST !!!

I received my license several years ago, and shortly after moved into a covenant restricted subdivision, so I spent only a few months on radio. I am just now getting back to it.
But more to your question about the education process, I think it leaves something to be desired. So much of the emphasis is on learning answers to the questions in the pool, and, based on my own experience, very little on making sure you really understand the principles. I did take a class for Technician, but really could have passed just using the books that explain answers to the pool questions.
You could argue that if you learn the answers to the pool questions then you have learned quite a bit, and that may be true, but I think the approach could be more geared to learning, then testing to see what you've learned.
I wasn't a technician very long before I passed my General test and the code test. I'm sure I learned a lot during that process, but I've forgotten much of what I learned. Thus, my question.
But it seems that at least one other person on this group agreed that you don't have a carrier unless you either are in CW mode or talking into the microphone, so perhaps my situation isn't unique. And the hams I asked in my community (three of them) didn't understand why it didn't work, either. I do feel like my knowledge of radio is woefully inadequate, but I'm not sure that is an indictment of the system. But the folks on this group really seem to know their way around the hobby. As a guy who learned everything he knows about radio, wave propagation and electronics from the technician and general books, I am quite amazed by your knowledge. And, I very much appreciate your taking the time to answer my question.

Hi all,
Tuesday evening our store was broken into. Our Yaesu FT897 with LDG AT897 two binatone PMR 446 have been stolen. If you could all keep an eye open for this combination coming up for sale please. It is unlikely the thieves know what they have got so i expect it will turn up on Ebay. also stolen was a PC uses to link the radio with HRD the interface was a G4ZLP USB multiface. The PC itself is machine i built out of spare parts so is basically untraceable. I am sure i have serial numbers somewhere and will post them if i find the safe place i put them in.

Hello Geoff,

Thank you for your input on the parameters of modulation and carrier techniques.

I fully agree, these topics may have been taught to candidates for the basic theoretical knowledge required for the relevant theory levels for admission to the licensed radio hobby !!

Question which must be asked ,,, Was it LEARNED. and understood, in practice.

Unfortunately the days of home brew construction of filters, traps, and oscillators would seem to too "old fashioned" for some, and for others, the importance of topics like these are considered as trivial,,, only good for 6 mark questions in a club quiz. and not used as an integral part of "operating hobby radio"

I personally never had to learn the theory of "DSP",,, but although I do not use it,,, I read up on the subject, enough to understand how it works. [in theory]

I would feel much more at home building a "noise filter", for whatever band I was having interference.

It really amazes me when I read posts from people who claim to be "nubies" ??? but have shelves full of oscilloscopes, and analysers. Yet are asking for help on topics which they should know, with the lowest level of qualification. Do we blame the training system, or the people who set the standard for the exam questions,,,

Geoff, could you imagine a teacher telling the class,,, this is on the syllabus,,, but is never on the question list ?????

Or have you seen or heard heated arguments, on the topic of "publishing the questions, and answers"

My o my, how attitudes have changed. How vast the improvements in technology !!! but still the basics of electron migration and propagation are still the same,,, even though sometimes considered "obsolete" and "unnecessary" in today's digital age.

Amateur Radio is considered a hobby, including self training in acquired skills and knowledge, but is being allowed to slide into a contest of "how much you paid for the latest black box", it is a hands on practical application of your knowledge and skill, in using the equipment you have, to the best advantage.[and reading the instruction manual]

In every aspect of the hobby, it now seems that if you buy the most expensive stuff, it will go on its own, and you can sit back and fill in the log, at leisure.,,, where is the skill in that !!!

This is probably too far off topic , and much too drawn out ranting from my favourite soap box, so to avoid being of offence to anyone personally, I apologise for my beliefs, but am not forcing anyone to share them out of necessity.

I just like my radio to be a learning experience each time I use the bands !

Best regards to all _____ Peter EI4HX

>

A1 or CW, the modulation is conveyed by transmitting either a full carrier (key down) or no carrier (key up).

A3 or AM, the modulation is conveyed by transmitted by varying the carrier amplitude to represent the audio signal. Typically, the higher the positive amplitude of the modulating signal, the higher the carrier level, the higher the negative amplitude, the lower the carrier level. Because of this, normally the resting carrier level (no modulation) is at half the peak carrier level in terms of voltage.

In the case of AM, the percentage (depth of) mosulation can vary between perhaps 30% on some broadast services to close to 100% for communication services.

F3 or FM, the modulation is conveyed by varying the frequency of the carrier. Typically, the higher the positive amplitude of the modulating signal, the higher the carrier frequency, the higher the negative amplitude, the lower the carrier frequency. With no modulation, the carrier frequency is at the nominal frequency.

In the case of F3, the movement (deviation) of the carrier frequency for audio cen be between perhaps 3kHz for communication to as much as 100kHz for broadcast audio.

I would have thought that all licenced amateurs should know this.

Geoff

I took my General exam about 3 months ago, and I don't remember
specific questions about modulation... but I have a notoriously short
memory.

Interestingly enough, I learned most of my radio theory from a book on
CB communications that was written back when CB radios had 23
channels. That's where I learned about AM, SSB, propogation,
wavelength, and antenna design.

Really Ed, I don't think that I would be surprised, but I also agree with
you that there are quite a few very clever amateurs about. My main
interest is microwave operating (even though I have a FT897D) and I am
acquainted with some extremely knowledgeable amateurs from both sides of
the Atlantic.

I do think that amateurs, of whatever grade licence, should seek to
improve their knowledge - I mean, the purpose of amateur privileges is
self-training, or at least it is so in the UK.

Hmm, I do use my 897's DSP, but I would not be able to design and build one from scratch, but I know enough to know where to look to design using appropriate chips - at least I think I do!

In the UK, there are growing question pools for each level of exam, but
they are not published.

This is regrettably so, to win a contest requires the skills of obtaining
the best location, the highest and biggest aerial and best radio - and
putting them all together. I'm glad that I am not into contests!

I would suggest that the microwave scene is not like that. In fact there
is very little commercial equipment above 23cm (only DEMI and DB6NT)

You are 100% right, Geoff, and I don't mean to imply that the "system" is to blame for my ignorance. I'm just getting back into radio and am trying to get up to speed. I have the tech and general books on hold at the library (I donated mine to the local radio club when I moved). Yes, hams should seek to improve their knowledge. Your point, though I don't think is was directed at me personally, is well-taken.

Well, let's be honest: this very thing is the source of much debate, frustration, and occasional flare-up elsewhere.

It's part of the fundamental question of "what is ham radio?" It means different things to different people, and I think it's important to remember that we all have different levels of technical knowledge.

So you forgot a technical detail. Big whoop. We all do that. The key is that you knew what to do about it. You asked questions and applied the answers.

I don't expect every ham to know the technical details of every rig. As long as he can operate that rig without interfering with other people or putting someone in danger, I have no right or reason to even care about what he's doing. However, too many people see it differently; they see themselves as the guardians of tradition, and they want to belittle anyone who doesn't meet their standards or do things their way.

I don't say that to demean anybody here, and I'm NOT pointing fingers. But you've all seen the attitude.

Fortunately, it's a big world, and there's room for all of us - even the ones who don't want us here. :-)

Well I have acted as a tutor for the UK's Foundation and Intermediate
licences and certainly modulation techniques is taught on both levels.

Hmm, I do use my 897's DSP, but I would not be able to design and build
one from scratch, but I know enough to know where to look to design using
appropriate chips - at least I think I do!

In the UK, there are growing question pools for each level of exam, but
they are not published.

This is regrettably so, to win a contest requires the skills of obtaining
the best location, the highest and biggest aerial and best radio - and
putting them all together. I'm glad that I am not into contests!

I would suggest that the microwave scene is not like that. In fact there
is very little commercial equipment above 23cm (only DEMI and DB6NT)

Thanks Tom, I couldn't have said it better myself. It seems that over the last few months, there has been an aggressive attitude looming. If some of the questions seem basic so what, it's not their fault, they passed their test. At least they are asking! After all, this is a message board and I thought one of the main purposes was to ask questions if you need help and answer questions if you are able to help. If people ask questions and get help, then they become a better operator. But if they feel they will be mocked, then many will stop asking, and that's the wrong answer.

Just my opinion.

26999. ft 897 only please

Yahoo group: FT897 (2009)
Date: 2009-07-24 00:43:20 UTC
From: customgraphics!
Topic: 26999 Message: 26999

please limit this group to ft897-related questions...

there has got to be a ham radio q&a group somewhere else... prolly a HRD, J pole, & g5rv too...

this group supports the 897 and if we get "too much to read" ppl will quit.

if your post doesn't have "897" in it, please find another way to ask :)

27000. Re: [FT897] ft 897 only please

From: Randy Charles Ford
Topic: 26999 Message: 27000

"This Group is dedicated to the discussion, operation, and application of the Yaesu FT-897 FT-897D amateur radios. Civility is very important in this group."

Most people on this list seem to think it germane to discuss how to get your rig working in your environment, which of course includes your antenna system, power supply, and physical environment. Many, many, times people post here thinking that they have a problem with one component, only to find after discussion that the problem is elsewhere.

This is a moderated group, and the moderator has show good judgment on when to end threads. Most mail clients have the ability to allow one to kill threads based on subject if one finds them getting too annoying. I find the next button to be sufficeint..

One of the guidelines of this group is to post your call sign.

Topic: 27002 Message: 27002

Hi... I just bought a used 897D (Sept. 2006 vintage) and as I'm checking it out I notice the cooling fan(s) always run, at any output power, even 5 watts, when in transmit mode. Is this normal?

I'd expect it at high power, or after some time in tx mode, but the fan(s) run every time when transmitting.

27003. Re: Is it normal for cooling fans to run anytime one is in tx mode?

Yes, evidently that is normal operation. On both my FT897D and non-D units, the fan will run as soon as it goes into x-mit, and then a few seconds after it goes back to receive, the fan stops. This is at any power level.

Hi Ed,

I didn't direct my oomments at anybody, certainly not you, except in the
sense that I agree with you.

In the UK there are three classes of licence (excluding club, repeater,
beaon and special event licences etc, which are normally issued as a
variation on a Full licence). There is some low level debate about
allowing one to hole a Foundation (level) licence for a limited perion
only.

Personally, I don't support this idea as, for example, my three offspring,
who hold Foundation licences, are too busy building their lives, families
and careers at the moment, but hopefully, Amateur Radio will be there when
their time permits. I am semi-retired at the moment.

Because, as you are in TX, the finals start to get hot. The way to cool it is to have the fans turn on when transmitting. That is why they go on in TX mode.

Yes, evidently that is normal operation. On both my FT897D and non-D units, the fan will run as soon as it goes into x-mit, and then a few seconds after it goes back to receive, the fan stops. This is at any power level.

27009. Re: FORGET WHAT YOU LEARNED WAY OFF TOPIC !!! [read the original post]

Yahoo group: FT897 (2009)
Date: 2009-07-24 10:35:40 UTC
From: P Grant
Topic: 27009 Message: 27009

TO WHOM IT MAY CONCERN

From Peter Grant, the happy owner of an FT897D.

Here in Ireland we have a thing called the wooden spoon syndrome !

It is a fancy term for a person who is " STIRRING IT"

You can guess what is being stirred !

So as you say your self " you have no right or reason to even care"

Boy that is a great attitude,,,
I like my FT897D.

you say it does not matter if someone forgets the basic rules for using radio !!

I just hope you do not drive an automobile,, with that attitude towards licencing I hope to never meet you on the road,,,, I drive on the left hand side of the road,,, in your country they are supposed to drive on the right,,,, you don't mind if now and then someone drives down your street, on the wrong side,,, sure they can ask someone which is the right way later,,, just as long as they knew they should ask if they forgot the basics.

Modern radio licensing Examinations allow a fair amount of leeway, in obtaining a pass.
In some countries that allows for 40% of the answers to be totally incorrect, and a mere 60% correct for a pass.

Thats all fine and dandy until the knowledge missing in the 40% failure becomes the normal thing, and is allowed to go on un checked.
I use my FT897D nearly every day.

This could equate that at any time, in any group,,, 60% knew all the information,,, and 40% knew nothing.on average.

I know it's an anomaly,,, BUT,,, would it work in the case of the driving test being OK, with a 60% information level, and be allowed to ask someone who is a good driver, where they went wrong,,, if they kill someone, while going through a red light.

OK,,, so the comparison is not a fair one,,, but still,,, you cannot hide the truth, OK,,, it's only a hobby,,, so is bee-keeping, and sky diving,, they also have their own rules, and if they are "forgot", there can be dire circumstances for everyone.

I like my FT897D, and always try to help anyone with a problem, with a full answer to the best of my ability.

I do not deliberately cross question someone else who has answered a question on this forum,,, I drew attention to the "hopeless answers", which he got off forum.

[read the original post]

I freely admit, that at my age I do need to look back at formulae which I have not used for several years,,, but as in the case of forgeting even 1% of the rules of the road,,,, then it is time I throw in the towel. I don't belong behind a wheel.

QUESTION ???

If you had a 60% pass in your driving test,,, would you be good enough to teach others ???

I passed my C&G RAE, theory exam in 1983, [96%] my first callsign was GI1NKT.I am not perfect, hopeless at spelling, and I love my radio hobby. Why should I challenge someone else's "answers" I also try to learn something new as often as I can.

As someone said,,, this is the cause of much debate ???

Thanks to everyone for their concern. Peter _____ EI4HX / GI0UGW

Subject: Re: [FT897] Re: Rig's SWR Meter SEE ORIGINAL POST !!!

Well, let's be honest: this very thing is the source of much debate, frustration, and occasional flare-up elsewhere.

It's part of the fundamental question of "what is ham radio?" It means different things to different people, and I think it's important to remember that we all have different levels of technical knowledge.

So you forgot a technical detail. Big whoop. We all do that. The key is that you knew what to do about it. You asked questions and applied the answers.

I don't expect every ham to know the technical details of every rig. As long as he can operate that rig without interfering with other people or putting someone in danger, I have no right or reason to even care about what he's doing. However, too many people see it differently; they see themselves as the guardians of tradition, and they want to belittle anyone who doesn't meet their standards or do things their way.

I don't say that to demean anybody here, and I'm NOT pointing fingers. But you've all seen the attitude.

Fortunately, it's a big world, and there's room for all of us - even the ones who don't want us here. :-)

From: Michael Walker (VA3MW)
Topic: 27001 Message: 27010

A 20amp power supply will work just fine unless you are going to do RTTY contesting at full power. If you want to do RTTY, the drop back to 50 watts and live with the signal that is 3db less.

We have run 20a PS on all of our HF rigs in many contests running at 100watts for both ssb and cw and never had a problem. I have had great success with the Astron RS20A and the Alinco switching supply (again for contesting). Both are great value for the money.

Moving to a higher amperage supply isn't a bad thing at all, but don't spend the money unless you want to or really need the power requirement.

27013. Can't get frequency read-out over CAT after using FTBasicMMO on FT-897D

Yahoo group: FT897 (2009)
Date: 2009-07-24 16:25:38 UTC
From: Frank Krasnicki
Topic: 27013 Message: 27013

I bought FTBasicMMO to program memories on my FT-897D about 2 years ago. It's worked flawlessly up until a week or so ago. I tried writing to the rig, and for some reason got a flashing error message. Then I tried reading from the rig...same thing. I tried resetting the rig back to factory defaults...no joy..same problem. The rig now only responds to CAT commands from MixW, not from HRD or any other application with CAT command capability.
I tried using the CAT command utility in HRD, and found that the rig will accept CAT commands, but won't read out Rx or Tx frequency status on CAT.
I contacted Yaesu tech support, and they told me that it sounds like the EEPROM is messed up. They said this has happened before when using memory programming software other than RT Systems apps(sounded like they were pushing that software). Before I send the rig back for repair, I'd like to know if anyone else has had similar problems.

There are 2 ports. One is the CAT the other is DATA. For FTBASICMMO, you need to use the DATA port - NOT the CAT port.

That would be a difficult mistake to make; the CAT cable won't fit in the data port.

Having said that...

Yaesu has a relationship with RT systems. RT is the developer of the software that comes with the Yaesu programming kits, so it's natural for Vertex to encourage users to buy their package, rather than a third party product.

The usual rule in these situations is for one vendor to blame another; it happens all the time in the sofware world. As a software engineer, I'm often caught between bugs in MS software and problems in my product. We usually end up footing the bill to fix our software to work around Microsoft's problems.

It sounds like you may have to send the radio back to Vertex to have the EEProm wiped and re-written, and then you'll have to choose whether to continue to use Bob's program or buy the RT data systems program.

I would also strongly encourage you to contact Bob Freeth G4HFQ and tell him about the issue. Even if he doesn't have a fix for your radio, he needs to know that his sofware has a potential problem or at least that Vertex is blaming him for the issue.

Good luck, and let us know what happens.

Oops. I missread your post, Dennis.

The data port is only for audio/PTT on this rig. The CAT port is for
cloning, tuner, and linear control.

27017. Re: Can't get frequency read-out over CAT after using FTBasicMMO on FT-897D

Yahoo group: FT897 (2009)
Date: 2009-07-25 00:57:28 UTC
From: Robert G. Schaffrath
Topic: 27013 Message: 27017

Just out of curiosity, what version of FTBasicMMO are you running? I have 1.2.6 and it has worked fine so far though it is not a program I use a lot because once the rig is programmed there is little need to make extensive changes.

I do find it odd that the program could corrupt the EEPROM. FTBasicMMO works with the radio in clone mode and I don't believe the software uses any of the undocumented CAT commands that can effect the radio. The ability to write to portions of the EEPROM is supposed to be protected which is why the freeband software does not open up the FT-897D. Those memory locations are now write protected.
I suppose there is the possibility that somehow the radio misinterpreted a command sequence and overrode the protections. That alone is intriguing because it would indicate that our radios could be flashed with newer firmware if Yaesu were to provide such updates rather than having us send the radio back to them.

Sorry - this is wrong. You use the 8-pin CAT port for FTBasicMMO. the 6-pin data port is for packet and is in fact audio in/out.

Frank,

If the radio will accept commands from programs but will not return answers then it sounds like a fault in the programming cable - the TX side of the circuit working but not the RX side.

First things to check are the pins on the 8-pin mini-din to see if anything is bent or pushed into the body.

Is USB involved in the connection between PC and radio or are we dealing with a real serial port?

The CommTest program on my download page will show if anything is coming in from the radio. Also the Com port detector command on FTBasicMMO's Tools menu will do the same.

If you have a friend with a 'known to work' cable then try his cable on your PC and your cable on his. Don't suspect the radio until you KNOW that the cable works properly.

Topic: 27013 Message: 27020

Frank

Some simple questions.

Make sure you are 100% sure it is still the same com port (I'm sure you done that).

Is there anything else that might have the com port open as only open application can open the com port at a given time.

If you have both of these problems eliminated, then Yaesu might be right. I assume you did a reset of the radio as a last ditch effort.

Subject: [FT897] Can't get frequency read-out over CAT after using FTBasicMMO on FT-897D

I bought FTBasicMMO to program memories on my FT-897D about 2 years ago. It's worked flawlessly up until a week or so ago. I tried writing to the rig, and for some reason got a flashing error message. Then I tried reading from the rig...same thing. I tried resetting the rig back to factory defaults...no joy..same problem. The rig now only responds to CAT commands from MixW, not from HRD or any other application with CAT command capability.
I tried using the CAT command utility in HRD, and found that the rig will accept CAT commands, but won't read out Rx or Tx frequency status on CAT.
I contacted Yaesu tech support, and they told me that it sounds like the EEPROM is messed up. They said this has happened before when using memory programming software other than RT Systems apps(sounded like they were pushing that software). Before I send the rig back for repair, I'd like to know if anyone else has had similar problems.

Also, try monitoring the serial port to see what is actually going on. Try using something like Portmon (described on Simon's page) http://www.ham-radio-deluxe.com/Support/SerialPortMonitor/tabid/83/Default.aspx.

It might provide some clues.

Oops. I missread your post, Dennis.

The data port is only for audio/PTT on this rig. The CAT port is for cloning, tuner, and linear control.

From: Paul Graham
Topic: 26973 Message: 27022

Hello Peter,

I've only just checked this account, so only just got your email. Okay, AM and FM both have carriers, which will also contain side bands. The next time you run your test, tune a little either way, you'll hear the whistle. It doesn't matter which band you are on, the modes are the same on 14Mhz as they are on 144Mhz. If you can hear each other on FM then you'll be able to hear a whistle when you tune to one side when listening to his FM signl on USB. You'll also get the same effect on AM. You'll have to listen either up from his frequency a little, or down.

The way I see it, so long as people have to tune then someone will hear them. I don't see it as something we have to put up with, rather just a part of the hobby. A bit like me washing the dishes (and I HATE washing the dishes) :)

I've not read the posts above this one yet, so I have no idea if someone else has commented. Any way, give it a go, you'll hear the whistles :)

Paul.

Subject: Re: [FT897] Rig's SWR Meter SEE ORIGINAL POST !!!

Hello Paul

As regarding tuning on FM, I was always taught that that was the thing to do !

I would have replied an hour earlier, but I wanted to see if I could back up my suggestion. I telephoned a friend, who lives about 2 Miles away from me.

We ran an experiment, he transmitted 5 watts FM into his 40 M, Buddistick, to simulate tuning on 7.105 MhZ, ,, We tried several attempts, and although we are only 2 miles apart there was no sign of audio interference while listening on HF.

We were using 145.200 FM as a talk channel, on 5 watts.

Just to be sure, we repeated a test while tuned to a strong local HF station which was transmitting on 7.068 MHz, in this case I could not detect any s meter action, as compared to when on FM mode on a clear channel, neither was there any "noise", while testing on SSB on a clear channel.

I am 100% sure that there is an alternative to my way of thinking, and am always prepared to learn something new.

I do not own a "Buddipole or Buddistick", antenna system, but am impressed at the construction, and versatility of the product.

By the way,,, My friend was using the Vertical buddistick, when doing the test transmission, and I was using a 40M horizontal di pole.

With regard to "all the button pushing",,,, , to tune up the buddistick, after some practice you will find you can reduce the number of PTT's needed to set up to resonance on the various bands you use.

Another complaint I have heard is the "menu" setting changes needed using the 897, I have blocked out all the settings which I do not use. Out of the 90+ menu settings, I only use 8. Of these I set in memory the readings which I use most frequently.

I am using my 897 more and more as my base rig, as I find it quite easy to operate, I also have the FT857, which I intended to use .Mobile, but never actually got around to setting up mobile antennas correctly. So I am using VHF only in this car. It's a Peugeot 407 estate with the full glass roof, ,,, there is just enough roof at the back, for a triple mag-mount, and tuning a 80 M, Pro-Am needs a lot more metal than I have available.

My "Big" radio for the shack, is the FT 767 GX, which although old, is all I can ask for. It has no DSP, but it does have an equally good CAT system, which I use on Digi modes a lot.

I am not a buddipole "user", and therefore probably do not qualify to answer questions on this forum, at all !!

Paul, I have just re read your post ,,, No,,, I have never tuned through VHF on SSB, and heard anything unusual, but I will try to do that during a VHF contest when there are plenty of stations working. As I said, I was always told to use FM for tuning, so I did the experiment earlier. I will also admit that there may be a vast difference between HF, and VHF, in this case.

My final comment is that up until today, I would have lost any bet, regarding the FT897, sending a carrier on CW, via the PTT, unlike some older radios. It does not !!!

We live and learn,, me included.... Jack of all trades, and a master of ONE.

Best 73 _____ Peter EI4HX ei4hxperimental@ eircom.net

Hello Peter,

Just out of interest, who told you that tuning on FM doesn't interfere with SSB? Or are you not saying that? Have you ever tuned through VHF on USB and listen to the whistles created from stations transmitting on FM? I use FM to tune, simply because it's convenient (and I don't have a key). I did miss the obvious one though (THANKS ERIC!), tune on AM. As I'm only allowed 50 watts (2E0) AM drops off to about 12 watts. Its going to save me quite a bit of button pushing :)

Paul.

Read some of the advise he got before posting here in his original post !!!

Hello again Ed,

I hope all this advice has helped you understand the facts relating to "no output " showing on the meter when you PTT using SSB.
As you already told us, there is power on PTT on VHF, I presume FM,,,,

Just a small reminder,,, when you are transmitting a signal through your "buddipole", to help with tuning,,,, DO NOT USE CW MODE,,, use FM only...

There are far too many thoughtless users tuning on CW, ,,, this is transmitting a tone on the frequency while you are making your adjustments. .. Yes readers,,, that is why you can hear constant blasts of "tone", all over the bands,,, not so common, or not as long as used to be,,, a lot of users now have "auto tuners" which only transmit tone for 2 - 5 seconds,,, but still enough to loose that special rare QSO. You can hear lots of idiots tuning on the band, any time there is a pile up,, and these are the people who criticise others for not knowing everything.

Enough said Ed,,, use FM, mode for the short transmissions, when "tuning " your Buddipole on the HF bands,,, when you get familiar with tuning up the "Buddipole", you will laugh at those who cannot use an SWR meter,,, and spend hundreds of $$$ on Antennalisers !!!

Hope to work you soon

Hello Mike,

You have concerns about the basics of the question? Well I have concerns about the way the foundation and intermediate exams are marked here in the UK! Are they the same the world over? If I have this right (and I believe I do, but please put me right if I'm wrong), club members (full license holders) mark the exam. I'm not saying that anything untoward happens, but the only thing stopping anything untoward from happening that I can see is the honesty of the people doing the marking. Are they marking 'accurately' or are they marking in a way they they may think is best for the hobby? i.e. the more people that are passed the more operators there are, or the more people they pass the higher the clubs pass rate is. And to think, we are told we can't talk politics on the radio. So then why don't we stop playing politicians? I for one know people who have recently passed their intermediate who didn't even complete all of the practical modules, let alone
answer enough questions correctly to get a pass in the theory!

If we have exams that people have to pass in order to use this equipment, then isn't it about time people had to start passing the exams? Until then, people (including me) will question the validity of my (and everyone elses) intermediate call, because in my eyes it isn't worth the paper it was printed on simply because for all you know I may have been 'allowed' to pass! So, now I have to do get a full license as this is the only license we have that is actually sent away to be marked properly.

Well, I guess that's my head on the block now, so everyone take their best swing, please make it quick :)

Paul.

Subject: RE: [FT897] Rig's SWR Meter SEE ORIGINAL POST !!!

I've got some concerns with the basics of this question.

FM, CW or AM. All produce a constant carrier. You can measure swr with any
of them with FM and CW normally being the same power.

But, I have to ask. Was the differences between these carrier modes (A1, F1
and A3) not taught in the classes you had to take in the Amateur classes and
also part of the test for the amateur radio certificate and how each related
to the power output from your transmitter?

I am not targeting the person who had the original post at all. But, I am
targeting the education process. This is a very basic question that each
and every amateur needs to understand 100%.

Subject: [FT897] Rig's SWR Meter

I posted this question a couple of days ago, then decided I needed to do more of my own research, because there has to be something simple I'm missing. But I haven't found the answer, even talking to a couple of hams who have 857s.
The problem is the SWR meter on the 897D doesn't react at all when I'm on the HF bands (unless I'm talking into the mike). When I'm in FM mode on the VHF bands it works fine. Here is what I am doing: I have my rig hooked up to a Buddistick. The stick is about 9 feet off the ground. Per the manufacturer' s instructions, I have the counterpoise wound out about 31 feet and elevated off the ground about 4 feet. I can hear very well on 40 meters, and I've made a couple of contacts. But when I try to check my SWR, the meter doesn't move when I key the mike without speaking. I've put it in CW mode to get a constant carrier and keyed the mike, but the needle still doesn't move. And I'm not getting an HSWR warning. I bought a Radio Shack SWR meter and have exactly the same problem. I can't even calibrate it. I've been told to turn my mike gain to 0, and others said to jack it way up. Neither had any effect, so I've put it back to the default, 50. One person suggested I increase my carrier signal, but I'm not sure how to do that. I know I must be missing something simple, but for the life of me I don't know what it is. This isn't my first HF rig, but it's the first time I've had this problem. I'd really appreciate your help.

First, to all of you. yes. this is way off topic (and I am the king of not going there.but let me have my turn) LOL

The hobby world wide is in trouble. The one way to measure that is that our numbers of declining and the average age is increasing rapidly. It has been well documented in many places.

So, as hams, we struggle to increase our numbers (which is good) and ensure that we are technically competent (and that varies by country).

As an example, my FT897 has many options. Technology is my hobby (I was licensed in 1974) and I am still learning. I'm not afraid to break things while trying something new. However, that is not the same for most of the younger people (not sure what the demographics are). If it moves electrons, I'm likely to take it apart and figure out why. I've got a problem with my 897 that it doesn't transmit (or go into transmit). Likely a CPU problem (not the mic-I've changed that), but before I reset it, I want to make sure I didn't lock it somehow-I'm pretty sure at this point the cpu needs a reset as I have tried everything else (no, split isn't on and the TX isn't somewhere in never never land).

Since I hire technical staff for a software call center, I find it difficult to find people with have good trouble shooting skills and technically understand what is 'really' going on and the impact of other parts of the technology. Have any of you ever had a good support phone call with your cell provider or you TV provider (if you have one)? (I rest my case).

I feel that examiners are sort of stuck in a hard place. We want new hams. We want them to understand. But, no all have the same technical prowess as the next guy.

I'm off soapbox and sorry for taking up the bandwidth.

Hello Paul

I have done as you suggested, Tuned around the 2M , FM, band in SSB,,, there was no real big whistling noises to be found, either using the RF Gain, or Squelch settings !

If I played with the rit control on SSB, I could make a little heterodyne type whistle come through,,,. funny thing though I could do this on channel or between channels, and at no time was there a FM QSO happening, when I did the "test"...

I'll have to try when there is a few stations on the band !

I am still not convinced that there is a noise transmitted with dead carrier on FM, whether you are listening on SSB, but certainly not on FM ..... !! ... Perhaps with modulation ???

cheers for now. Peter EI4HX

Subject: Re: [FT897] Rig's SWR Meter SEE ORIGINAL POST !!!

Hello Peter,

I've only just checked this account, so only just got your email. Okay, AM and FM both have carriers, which will also contain side bands. The next time you run your test, tune a little either way, you'll hear the whistle. It doesn't matter which band you are on, the modes are the same on 14Mhz as they are on 144Mhz. If you can hear each other on FM then you'll be able to hear a whistle when you tune to one side when listening to his FM signl on USB. You'll also get the same effect on AM. You'll have to listen either up from his frequency a little, or down.

The way I see it, so long as people have to tune then someone will hear them. I don't see it as something we have to put up with, rather just a part of the hobby. A bit like me washing the dishes (and I HATE washing the dishes) :)

I've not read the posts above this one yet, so I have no idea if someone else has commented. Any way, give it a go, you'll hear the whistles :)

Paul.

Hello Paul

As regarding tuning on FM, I was always taught that that was the thing to do !

I would have replied an hour earlier, but I wanted to see if I could back up my suggestion. I telephoned a friend, who lives about 2 Miles away from me.

We ran an experiment, he transmitted 5 watts FM into his 40 M, Buddistick, to simulate tuning on 7.105 MhZ, ,, We tried several attempts, and although we are only 2 miles apart there was no sign of audio interference while listening on HF.

We were using 145.200 FM as a talk channel, on 5 watts.

Just to be sure, we repeated a test while tuned to a strong local HF station which was transmitting on 7.068 MHz, in this case I could not detect any s meter action, as compared to when on FM mode on a clear channel, neither was there any "noise", while testing on SSB on a clear channel.

I am 100% sure that there is an alternative to my way of thinking, and am always prepared to learn something new.

I do not own a "Buddipole or Buddistick", antenna system, but am impressed at the construction, and versatility of the product.

By the way,,, My friend was using the Vertical buddistick, when doing the test transmission, and I was using a 40M horizontal di pole.

With regard to "all the button pushing",,,, , to tune up the buddistick, after some practice you will find you can reduce the number of PTT's needed to set up to resonance on the various bands you use.

Another complaint I have heard is the "menu" setting changes needed using the 897,
I have blocked out all the settings which I do not use. Out of the 90+ menu settings, I only use 8. Of these I set in memory the readings which I use most frequently.

I am using my 897 more and more as my base rig, as I find it quite easy to operate, I also have the FT857, which I intended to use .Mobile, but never actually got around to setting up mobile antennas correctly. So I am using VHF only in this car. It's a Peugeot 407 estate with the full glass roof, ,,, there is just enough roof at the back, for a triple mag-mount, and tuning a 80 M, Pro-Am needs a lot more metal than I have available.

My "Big" radio for the shack, is the FT 767 GX, which although old, is all I can ask for. It has no DSP, but it does have an equally good CAT system, which I use on Digi modes a lot.

I am not a buddipole "user", and therefore probably do not qualify to answer questions on this forum, at all !!

Paul, I have just re read your post ,,, No,,, I have never tuned through VHF on SSB, and heard anything unusual, but I will try to do that during a VHF contest when there are plenty of stations working. As I said, I was always told to use FM for tuning, so I did the experiment earlier. I will also admit that there may be a vast difference between HF, and VHF, in this case.

My final comment is that up until today, I would have lost any bet, regarding the FT897, sending a carrier on CW, via the PTT, unlike some older radios. It does not !!!

We live and learn,, me included.... Jack of all trades, and a master of ONE.

Hello Peter,

Just out of interest, who told you that tuning on FM doesn't interfere with SSB? Or are you not saying that? Have you ever tuned through VHF on USB and listen to the whistles created from stations transmitting on FM? I use FM to tune, simply because it's convenient (and I don't have a key). I did miss the obvious one though (THANKS ERIC!), tune on AM. As I'm only allowed 50 watts (2E0) AM drops off to about 12 watts. Its going to save me quite a bit of button pushing :)

Paul.

Read some of the advise he got before posting here in his original post !!!

Hello again Ed,

I hope all this advice has helped you understand the facts relating to "no output " showing on the meter when you PTT using SSB.
As you already told us, there is power on PTT on VHF, I presume FM,,,,

Just a small reminder,,, when you are transmitting a signal through your "buddipole", to help with tuning,,,, DO NOT USE CW MODE,,, use FM only...

There are far too many thoughtless users tuning on CW, ,,, this is transmitting a tone on the frequency while you are making your adjustments. .. Yes readers,,, that is why you can hear constant blasts of "tone", all over the bands,,, not so common, or not as long as used to be,,, a lot of users now have "auto tuners" which only transmit tone for 2 - 5 seconds,,, but still enough to loose that special rare QSO. You can hear lots of idiots tuning on the band, any time there is a pile up,, and these are the people who criticise others for not knowing everything.

Enough said Ed,,, use FM, mode for the short transmissions, when "tuning " your Buddipole on the HF bands,,, when you get familiar with tuning up the "Buddipole", you will laugh at those who cannot use an SWR meter,,, and spend hundreds of $$$ on Antennalisers !!!

Hope to work you soon

Hello Peter,

I double checked that I wasn't imagining things just before I sent the email. Find a signal on FM, switch to SSB and tune either side, you will hear a whistle. Even when the FM signal is a dead carrier (and therefore, technically, not FM as it's just an un-modulated and un-deviated signal).

Any way, I'm expecting to be lynched pretty soon as a result of my 'other' post, so if you don't hear back from me... :)

VA3MY DE EI4HX

Hello Michael

Sorry to hear you have a problem with your radio.
Just a wee bit of advice, before you re-set...
Click through your memory numbers,,, 1 -- 91 and make a note of your present settings,,, that way, you can have a chance to see if the re-set changes something which looked OK, when checking through the memories looking for a fault , but not finding one !!

Is all the advice I can give at this time !

To continue re your question on telephone helpdesk,,, I hate using them, but I must commend the "expert, I contacted when having a problem with my " Internet Security"

I telephoned the helpdesk,,, I was switched through to a "technician",, he instructed me to go on live keyboard , he ran a complete system scan,,, built up a "new" set of rules for my Spam filter, opened up back up files for my hundreds of e-mails, which I needed to keep,,, all the time corresponding via live keyboard talk,,, He told me we were 14 minutes on the helpdesk, and said he would put it down to a bad software up grade,,, so no charge. for the call !!

The guy was in New Deli, had perfect English,,, told me he was 17 years old and working his way through college, for an economics degree.. [it was 4.40 AM local with him]

If only all service calls were like that,,, I am still happily using my "Norton Internet Security," from "Symantec "

73's all Peter EI4HX ei4hxperimental@...

27028. Re: [FT897] exams - etc

Yahoo group: FT897 (2009)
Date: 2009-07-25 19:59:48 UTC
From: Paul Graham
Topic: 26973 Message: 27028

Hello Mike,

Yes, totally off topic, but we kind of wandered there and it does affect everyone in all kinds of ways.

Any way, I'm all for attracting new people into the hobby and I do agree that it is in trouble. But shouldn't a drop in standards (for want of a better word) come from the authority that sets those standards, not from people who think they should bend the rules because they think it does the hobby good? If the latter is why the examiners think they are there then maybe they should ask their governing body what they think.
If the authorities are saying yes there is an exam but use your common sense (or allow people through who would make good of the hobby even if they fail the exam - I don't imagine for a second they would do this) then fair enough. But unless someone tells me this is so then I can't agree with people taking matters into their own hands. If anything Ofcom (our governing body) have recently made changes to the intermediate licence that makes it a little more difficult (I may be wrong here, but I certainly don't think they made it easier, again, if someone could confirm this please).

I don't want to get into what they should be doing regarding the different levels of license and the privileges and conditions that go with those levels (again that's for the authorities to decide, and they have), just to say I totally disagree with full licensed examiners taking things into their own hands, even if they do think it is for the good of the hobby. I for one have been left with a callsign that means nothing to many people.

If we let standards slip then WE are to blame for the drop instandards. If this is what we are going to do then maybe Ofcom should just shut up shop and let us run the show? Now that's SCARY!

Paul.

Subject: [FT897] exams - etc

First, to all of you. yes. this is way off topic (and I am the king of not going there.but let me have my turn) LOL

The hobby world wide is in trouble. The one way to measure that is that our numbers of declining and the average age is increasing rapidly. It has been well documented in many places.

So, as hams, we struggle to increase our numbers (which is good) and ensure that we are technically competent (and that varies by country).

As an example, my FT897 has many options. Technology is my hobby (I was licensed in 1974) and I am still learning. I'm not afraid to break things while trying something new. However, that is not the same for most of the younger people (not sure what the demographics are). If it moves electrons, I'm likely to take it apart and figure out why. I've got a problem with my 897 that it doesn't transmit (or go into transmit). Likely a CPU problem (not the mic-I've changed that), but before I reset it, I want to make sure I didn't lock it somehow-I'm pretty sure at this point the cpu needs a reset as I have tried everything else (no, split isn't on and the TX isn't somewhere in never never land).

Since I hire technical staff for a software call center, I find it difficult to find people with have good trouble shooting skills and technically understand what is 'really' going on and the impact of other parts of the technology. Have any of you ever had a good support phone call with your cell provider or you TV provider (if you have one)? (I rest my case).

I feel that examiners are sort of stuck in a hard place. We want new hams. We want them to understand. But, no all have the same technical prowess as the next guy.

I'm off soapbox and sorry for taking up the bandwidth.

Subject: Re: [FT897] Rig's SWR Meter SEE ORIGINAL POST !!!

Hello Mike,

You have concerns about the basics of the question? Well I have concerns about the way the foundation and intermediate exams are marked here in the UK! Are they the same the world over? If I have this right (and I believe I do, but please put me right if I'm wrong), club members (full license holders) mark the exam. I'm not saying that anything untoward happens, but the only thing stopping anything untoward from happening that I can see is the honesty of the people doing the marking. Are they marking 'accurately' or are they marking in a way they they may think is best for the hobby? i.e. the more people that are passed the more operators there are, or the more people they pass the higher the clubs pass rate is. And to think, we are told we can't talk politics on the radio. So then why don't we stop playing politicians? I for one know people who have recently passed their intermediate who didn't even complete all of the practical modules, let alone
answer enough questions correctly to get a pass in the theory!

If we have exams that people have to pass in order to use this equipment, then isn't it about time people had to start passing the exams? Until then, people (including me) will question the validity of my (and everyone elses) intermediate call, because in my eyes it isn't worth the paper it was printed on simply because for all you know I may have been 'allowed' to

pass! So, now I have to do get a full license as this is the only license we have that is actually sent away to be marked properly.

Well, I guess that's my head on the block now, so everyone take their best swing, please make it quick :)

Paul.

I've got some concerns with the basics of this question.

FM, CW or AM. All produce a constant carrier. You can measure swr with any of them with FM and CW normally being the same power.

But, I have to ask. Was the differences between these carrier modes (A1, F1 and A3) not taught in the classes you had to take in the Amateur classes and also part of the test for the amateur radio certificate and how each related to the power output from your transmitter?

I am not targeting the person who had the original post at all. But, I am targeting the education process. This is a very basic question that each and every amateur needs to understand 100%.

Subject: [FT897] Rig's SWR Meter

I posted this question a couple of days ago, then decided I needed to do more of my own research, because there has to be something simple I'm missing. But I haven't found the answer, even talking to a couple of hams

who have 857s.
The problem is the SWR meter on the 897D doesn't react at all when I'm on the HF bands (unless I'm talking into the mike). When I'm in FM mode on the VHF bands it works fine. Here is what I am doing: I have my rig hooked up to a Buddistick. The stick is about 9 feet off the ground. Per the manufacturer' s instructions, I have the counterpoise wound out about 31 feet and elevated off the ground about 4 feet. I can hear very well on 40 meters, and I've made a couple of contacts. But when I try to check my SWR, the meter doesn't move when I key the mike without speaking. I've put it in CW mode to get a constant carrier and keyed the mike, but the needle still doesn't move. And I'm not getting an HSWR warning. I bought a Radio Shack SWR meter and have exactly the same problem. I can't even calibrate it. I've been told to turn my mike gain to 0, and others said to jack it way up. Neither had any effect, so I've put it back to the default, 50. One person suggested I increase my carrier signal, but I'm not sure how to do that. I know I must be missing something simple, but for the life of me I don't know what it is. This isn't my first HF rig, but it's the first time I've had this problem. I'd really appreciate your help.

Date: 2009-07-25 21:24:23 UTC
From: P Grant
Topic: 27029 Message: 27029

Hello Paul

I think you have finally got my point...

When using FM,, is it "just technically" Un Modulated, and Un Deviated signal, used to PTT when tuning up for SWR checks "on air" That is what I was trying to explain without being "Technical"

Go back to washing the dishes, and when you have that done,,, come over and do mine...

Best 73 from Ireland

P S ,,,, stop playing with the keyboard,,, there are some great stations working IOTA Contest..... DXCC in 2 hours ????? start NOW...

Hello Peter,

I double checked that I wasn't imagining things just before I sent the email. Find a signal on FM, switch to SSB and tune either side, you will hear a whistle. Even when the FM signal is a dead carrier (and therefore, technically, not FM as it's just an un-modulated and un-deviated signal).

Any way, I'm expecting to be lynched pretty soon as a result of my 'other' post, so if you don't hear back from me... :)

Paul :)

Hello Peter,

Just out of interest, who told you that tuning on FM doesn't interfere with SSB? Or are you not saying that? Have you ever tuned through VHF on USB and listen to the whistles created from stations transmitting on FM? I use FM to tune, simply because it's convenient (and I don't have a key). I did miss the obvious one though (THANKS ERIC!), tune on AM. As I'm only allowed 50 watts (2E0) AM drops off to about 12 watts. Its going to save me quite a bit of button pushing :)

Paul.

Subject: Re: [FT897] Rig's SWR Meter SEE ORIGINAL POST !!!

Read some of the advise he got before posting here in his original post !!!

Hello again Ed,

I hope all this advice has helped you understand the facts relating to "no output " showing on the meter when you PTT using SSB.
As you already told us, there is power on PTT on VHF, I presume FM,,,,

Just a small reminder,,, when you are transmitting a signal through your "buddipole", to help with tuning,,,, DO NOT USE CW MODE,,, use FM only...

There are far too many thoughtless users tuning on CW, ,,, this is transmitting a tone on the frequency while you are making your adjustments. .. Yes readers,,, that is why you can hear constant blasts of "tone", all over the bands,,, not so common, or not as long as used to be,,, a lot of users now have "auto tuners" which only transmit tone for 2 - 5 seconds,,, but still enough to loose that special rare QSO. You can hear lots of idiots tuning on the band, any time there is a pile up,, and these are the people who criticise others for not knowing everything.

Enough said Ed,,, use FM, mode for the short transmissions, when "tuning " your Buddipole on the HF bands,,, when you get familiar with tuning up the "Buddipole", you will laugh at those who cannot use an SWR meter,,, and spend hundreds of $$$ on Antennalisers !!!

Hope to work you soon

27032. Difficulty monitoring aircraft band

Yahoo group: FT897 (2009)
Date: 2009-07-26 14:58:38 UTC
From: ka8yiu
Topic: 27032 Message: 27032

My 897 will not receive the aircraft band. The signals will stop the scanning, if scanning, but no audio will come thru. The rig is set to AM, I have repositioned the antenna several times, and it still will not pick up audio. Aircraft on approach fly right over my house, but I still cannot get audio.

I have attached my 817 and, with the same antenna, picks up not only the aircraft, but the airport/ATC transmissions.

Any thoughts? A menu setting that I am not finding?

Kevin

Can you hear static? Have you checked the squelch settings? I am monitoring Orlando International Airport and can hear the planes and the airport no problem.

Yes, the squelch is set to just above the noise level. Any and all of the obvious have been checked. There is just no apparent reason for it. Even when turning the squelch down to hear the noise, their transmissions are mostly inaudible, and I am on the approach to the airport. I have used 3 different antennas and all the same result.

Assuming you're using the VHF/UHF port (we had someone a while back try to monitor AC on the HF port), you may simply have a bad receiver. I would contact Yaseu support (and let us know what you find out-for the next guy.)

It works great on 2 meters. I can hit repeaters several counties away, but can't hear an aircraft on AM that I could step outside and hear its engines or see with my eyes. Puzzling and annoying!

Have you tried listening to AM on other bands? Maybe have a QSO on 2 meter in AM to see if your AM mode works properly. If the problem reoccurs in other bands then most likely your hardware has failed. Also check your DSP and filter settings.

That did it! Works in Auto and Fast, but AGC had to be on (never would have thought that.)
The noise level is S7, but hearing now. Thanks!

What about AM reception in other bands? Aircraft use AM... Come to
think of it, do you have the receive mode set to AM?

Cycle through the menu buttons on the bottom and look for RPT. that cycles between +,-, and split.

6 cell, 12 volt, Lead-Acid and 4 cell, LiFe-Po4 lithium batteries are NOT ideal for the FT-897 or FT-857 series radios, as the voltage is too low over much of the discharge range! A far better choice is a Li-Poly 14.4 volt pack, consisting of 4 series connected sections, as most of its usable discharge voltage is between 16 and 12.5 volts. The radio will not normally perform PROPERLY below 12.5 volts-(yes, it will usually operate, but stability and transmit performance/quality will suffer) to be safest, you should terminate charging these batteries at 16.0 volts, rather than the normal 16.8 volts, or use a 20 ampere rated silicon diode in series during initial discharge to drop the voltage closer to 16.0 volts. this battery will deliver FULL performance, and a battery rated at 20 ampere-hours, weighing about the same as a 7 ampere-hour lead-acid cell, will give quite long service at the 100 watt or lower power level!--You MUST NOT discharge below 12.0 volts, nor charge above 16.8 volts, or battery damage is likely. Suitable batteries, with internal protection from cell imbalance, or over-discharge/shorting, and chargers may be found at "batteryspace.com"------Do NOT use for FT-817, use battery with 3 series sections for FT-817-nominal 11.2 volts, max charge is 12.6 volts, discharge is 9.0 volts.--73, KC3VO, Bob Curry

Hi Ted,

it is set for split where it receives on one VFO and transmits on the other.

Go to the menu row where the A/B, A=B is and you will find thet the SPL is
on (button C). Push the button and it is off again.

Hope that helps.

Bob is right.

LiPo batteries are amazing, but make sure you get a balanced charger (it has another connector that monitors the voltage of each individual cell) and also ensure that you do NOT discharge them below 12.0 V.

The RC Hobby guys have this all figured out already and they have voltage shut off devices and smart chargers that you can get for well under $50.

One of my Quad fliers (4 motors pulling straight up) will draw over 20A at 11.1 V. The battery weighs about 500grams and will deliver almost 5000maH. I get 9-15 minutes of flight time depending on the total weight of my bird with cameras.

Here is an example of one:
http://www.hobbyking.com/hobbycity/store/uh_viewItem.asp?idProduct=9260
<http://www.hobbyking.com/hobbycity/store/uh_viewItem.asp?idProduct=9260&Pro

27050. Using Rig In Jeep Liberty - Aweful Noisy

Yahoo group: FT897 (2009)
Date: 2009-07-27 04:19:29 UTC
From: cherokee_mule
Topic: 27050 Message: 27050

These past couple of weeks I have been working on installing my 897 in my Jeep Liberty Sport. The power leads run straight to the battery posts. The antenna is an ATAS-120. The mount is a K400. The radio is secured to the passenger seat. The antenna/mount is currently attached to the bottom lip of the rear hatch door.

On receive I pick up engine noise, and as I accellerate the noise becomes louder. I believe it is ignition noise because, 1) With the engine running I used a battery powered AM radio outside and in the rear of the Jeep with little noise, but received a lot of noise in the front seat area. 2) I pick up the same noise on the 897 in AM mode with antenna attached. 3) The 897 doesn't pick up any noise in AM mode when the engine is off. 4) There is no noise when the antenna is disconnected and the engine is on. 5) I connected the 897 directly to a second car battery, leaving the radio and antenna in/on the Jeep, and recived the same engine noise in AM mode while the engine was running.

Now for the weird results: 1) I first moved my antenna from the rear of the Jeep to the passenger side hood. A 45 minute drive into work resulted in little engine noise. The noise returned on the trip back home. 2) I used a 160W converter box, plugged into the cigarette lighter, to power the radio and received little noise on a 45 minute trip. After that the noise returned.

I am completely lost on what to do to eliminate the engine noise! Before starting this project I had to remove my 2meter radio and even had to clean the battery post due to the excessive corrosive buildup.

Could it be that my battery is not acting like a good capacitor and is needing replaced? Where do I go from here?

Thanks,

Deion "Mule" Christopher

DE N7UVL,
There is a lot of electrical noise devices in modern vehicles
that can cause RF Noise. When you say "louder" as you
accelerate, if the frequency of the interference noise does
not increase in relation to the acceleration, its not ignition
noise or alternator noise. As those sources change
repetitions with RPM change.
-If the noise actually gets "louder" as acceleration occurs,
the interference may be related to a device that changes
characteristics a bit when voltage to it increases. Something
that occurs as the alternator increases RPM's. The Alternator
Regulator may allow as much as a volt increase with increased
RPM's. With a digital volt meter monitoring you may see this.
Analog meters & eyeballs may not be sensitive enough to
see the voltage increase.
-Several manufacturer vehicle fuel pumps mounted inside
the gas tank are common source of RF noise. One Ham
here had both RF noise & vehicle stalling problems, that
turned out to be a loose ground wire on the firewall to
his ECM./ga

From: ok1fig
Topic: 27052 Message: 27052

Hello all,

I revealed that my internal (built-in) PSU produces a noise. I wonder whether it is a faulty PSU, or a "standard" behaviour. Can anybody make the following test for me, please:

1. Have the internal PSU installed normally, keep the mains cord plugged in
2. Disconnect 13.8V cord and use an external PSU
3. Disconnect both antennas
4. Switch the radio on, turn RF gain to max, AF gain to one third. Switch to 80m band
5. Toggle repeatedly the mains switch on the internal PSU (rear panel) on and off. Can you hear any difference in the noise the radio produces?

This test would help me a lot, thanks in advance.

What if you plug the radio right into the cigarette lighter for a receive test. I also know many hams that have run full power on SSB right from the lighter socket very successfully. I have also done it on many rental cars. You have also proven that the noise is not coming in the power leads however, so forget the battery as the problem for the time being.

You may also have to run some good bonding from the hood, doors and exhaust system to the frame. Use a 1" braid and self tapping screws. This will cut down the noise radiated by the engine.

Fuel pumps are the worst and a simple 0.1 uf cap right across the pump leads at the tank helps a lot.

Review K0BG's site for lots of good ideas: http://www.k0bg.com/ and http://www.k0bg.com/noiseid.html. He discusses bonding at http://www.k0bg.com/bonding.html

Welcome to HF mobiling! J

Deion -

Welcome to the noisy Jeep club.

I think everything everyone else has said is good. I've had bad noise from a Cherokee and Wranglers (no Liberty yet) and there were three things that helped me.

I started by using a battery powered shortwave receiver to sniff around the car for noise AND to try to find a quieter location for the antenna. The two most significant noise sources of radiated noise were the rear window defroster and the tailpipe, and the quietest location was smack dab in the center of the Cherokee's roof.

I experimented with some bypass cap values to knock the noise down from the rear window defroster, bonded the tailpipe to the chassis, and went to a mag mount on the roof. Signals improved, noise went down, much happier. Definitely not noise free but went from about an S9 to S3 or so on most bands.

Not the most satisfying - I'd have rather nipped it at the source, but good enough for most days.

Good luck, Scott

From: richardkd0gdv
Topic: 27032 Message: 27055

Make sure you're on the 108MHz band. If you're using a duplexer and switch (as I do for HF dipole and VHF/6M vertical), make sure you feed the 108MHz signal to the VHF/UHF side, not the HF side.

Being a pilot, I was monitoring KMCI over the weekend and had forgotten to switch from HF side. Couldn't hear a thing and knew there had to be an issue--and it was me!

> > My 897 will not receive the aircraft band. The signals will stop the scanning, if scanning, but no audio will come thru. The rig is set to AM, I have repositioned the antenna several times, and it still will not pick up audio. Aircraft on approach fly right over my house, but I still cannot get audio.

Paul

Did you solve this? I have the same problem with my FT857, and it has me stumped. Hitting PTT does not even stop a scan, but the light lights on the mic. And, the up/down keys, etc do work.

I have yet to reset the radio (holding off until I download all the memories).

Hello Paul

I cannot think of a fix off hand,,, But,,,
I notice you mention TX works OK, through your PC.

I wonder what [digi] mode you were last using, is there a possibility, you have inadvertently locked out the PTT control, somewhere using the digi software.
Try reading through your software control paperwork, and see can you find anything in that line. Read especially anything on "digital voice"
Best of luck with your problem.

Maybe this is common-mode noise entering the radio on the power cable,
or the antenna cable, or both.

You could try adding ferrites to reduce this noise.

I talk about the original Yaesu internal power supply for FT-897.
It is Yaesu FP-30.

Can anyone make the test as described above? It won't take you more than 5 minutes.

Thanks, Petr

Gday Deion.
I have a 2002 Jeep Liberty diesel (called a Cherokee Sport downunder) 4X4 also. I installed the 857 in it using the remote head. I also use the ATAS120-A. I have put a 40 mm aluminum box tube across the roof rails (towards the rear) and used the clips that clip on to the original cross bars to secure the box tube. I then ran three coax feeds into the "Liberty". One for local UHF cb, second on for duo-bander and the third one for HF. I have a tuning problem on the HF one but use the tune/up/down as I mainly use the mobile for psk31 on HF. I have put condensers (automotive capcitors) on my alternator, oil pressure sender and air conditioner compressor. Have a look at http://www.k0bg.com web site for Mobile Amateur Radio Operators in the bonding section, but then again the whole site is very informative. ope this helps

Peter,
That problem is a standard fault on the power supply and was taken care of by Yaesu in a retrofit.
I have the literature somewhere and will look for it.
It consisted in adding some small capacitors across the big capacitors in the Power supply.
I did the mod myself on mine and it works well.
I'll get back to you later today.

27062. Does anybody use the MFJ-1717PL back of set antenna...?

Yahoo group: FT897 (2009)
Date: 2009-07-28 20:32:54 UTC
From: Tom
Topic: 27062 Message: 27062

Until recently I have used my rig exclusively for HF and on twenty meters most of the time. Recently I have wanted to get back into some of the VHF and UHF activities here in our West Michigan area.
Although I have room (just barely!) for my simple wire antenna in my very small front yard, erecting another outdoor antenna for FM activity is simply out of the question.
Recently I saw an ad from MFJ concerning a "back-of-the-set", fold over VHF/UHF antenna that they are selling. It is listed as the MFJ-1717PL.
There is very little technical information concerning the specifics of this antenna on MFJ's web site. I did email them about it BUT they are taking their time returning my email inquiry.
Has anyone used this antenna with the 897d? If so, what are the power limits and what kind of performance did you get with this particular set-up?
Unfortunately my "shack" is in the basement of my home so using this type of an antenna might really be stretching it quite a bit in any case! I thought it might be worth asking you folks about it, however.
As always, thanks in advance for your help and advice!
As always... 73!

This antenna is only rated for 25W SSB, per MFJ. Probably
10W FM/AM, more or less.

At one time, I was considering buying one for my '897, but
the power limitation changed my plans.

Recently I saw an ad from MFJ concerning a "back-of-the-
set", fold over VHF/UHF antenna that they are selling. It is
listed as the MFJ-1717PL.
There is very little technical information concerning the
specifics of this antenna on MFJ's web site. I did email them
about it BUT they are taking their time returning my email
inquiry.
Has anyone used this antenna with the 897d? If so, what are the
power limits and what kind of performance did you get with this
particular set-up?

if you can put an HF wire antenna in the yard, why can't you put up a small 18" ground plane or even a 1 meter long dipole? That's a lot smaller than the wire antenna in the yard.

Tom, rather than invest in an MFJ antenna that will really be non-functional for you since it will be below ground, I would suggest a simple J-pole made from 300 ohm TV twin lead.

Detailed specs are available on many web sites. In general, a 2-meter j-pole is 54 inches long. I've made them from 300-ohm TV twin lead and from 450 ohm ladder line. I usually solder a BNC connector at the base, where the coax cable attaches, to make it more "portable" than if a coax were soldered directly to it. (You could use an S)-239 as well, depending on what kind of coax you would be using to connect it to your rig.)

I "drill" a small hole in the space between the two wires with a soldering iron, at the top end of the antenna, and run a foot of string through it, forming a 6" loop that allows me to hang the antenna from any small tree branch, or a nail driven into an overhead porch beam. I also have one in my office at work, where it hangs from a cup hook screwed into the ceiling tile in front of the window. It works fine for the repeaters that it can "see" out the window and between skyscrapers.

Connect the j-pole to your rig with as short a length of coax as is possible. Be sure to use either a balun made from coax (6 turns wound around a 2" diameter scrap of PVC pipe works well), or some ferrite beads. (The balun goes next to the antenna, not next to your rig.)

There are also plans on the Internet for dual-band j-poles for 2 meters and 70 cm with one antenna. I've made the one described in an article from QST magazine which is available at

http://www.qsl.net/k2gq/Portable%20JPole.pdf

It works just fine.

The beauty of the twin-lead J-pole is that you can take it down very easily when you're not using it -- thus no problems from whomever might object to a second antenna in the back yard.

I think a j-pole will work better for you than a ground plane antenna if you can find a place to hang it, because the take-off angle is lower and it will put more energy into nearby repeater antennas and less into the sky. It also has the benefit of not needing to be close to the ground. In fact, the higher you can hang it, the better.

Subject: [FT897] Using Rig In Jeep Liberty - Aweful Noisy

These past couple of weeks I have been working on installing my 897 in my Jeep Liberty Sport. The power leads run straight to the battery posts. The antenna is an ATAS-120. The mount is a K400. The radio is secured to the passenger seat. The antenna/mount is currently attached to the bottom lip of the rear hatch door.

On receive I pick up engine noise, and as I accellerate the noise becomes louder. I believe it is ignition noise because, 1) With the engine running I used a battery powered AM radio outside and in the rear of the Jeep with little noise, but received a lot of noise in the front seat area. 2) I pick up the same noise on the 897 in AM mode with antenna attached. 3) The 897 doesn't pick up any noise in AM mode when the engine is off. 4) There is no noise when the antenna is disconnected and the engine is on. 5) I connected the 897 directly to a second car battery, leaving the radio and antenna in/on the Jeep, and recived the same engine noise in AM mode while the engine was running.

Now for the weird results: 1) I first moved my antenna from the rear of the Jeep to the passenger side hood. A 45 minute drive into work resulted in little engine noise. The noise returned on the trip back home. 2) I used a 160W converter box, plugged into the cigarette lighter, to power the radio and received little noise on a 45 minute trip. After that the noise returned.

I am completely lost on what to do to eliminate the engine noise! Before starting this project I had to remove my 2meter radio and even had to clean the battery post due to the excessive corrosive buildup.

Could it be that my battery is not acting like a good capacitor and is needing replaced? Where do I go from here?

Thanks,

Deion "Mule" Christopher

Hi guys I am a now a proud new owner of one of these amazing little rigs and new to this group.
I also have a FT-901D, FT-101B, & FT-7B.I am also a member of the appropriate yahoo groups for these rigs as well.
So far I've been able to work out what is going on with this rig and all it's compilcated memory structures and am so very very happy.
This weekend coming it will go on it's first mobile excursion. I will report back on Monday with my impressions of it's mobile abilities.
Cheers for now from VK.

Hi Tom,

I don't have experience with THAT antenna. However, I do with homemade jobs.

First, be careful using much power with a back-of-the-set antenna. Modern radios are often very susceptible to their own RF and you may run into problems, not to mention exceeding human exposure limits.

That being said, it is extremely easy to make your own back-of-the-set antenna for 2 m/70 cm. Get a PL-259 standard coax connector and solder some stiff wire or brass tubing into the center conductor. Insulate this wire from the shield of the connector. Bend it at 90 degrees near the connector. Cut it to about 19 1/4". This antenna will resonate on both bands as a 1/4 wave antenna for 2 m and a 3/4 wave antenna on 70 cm. It will also handle a kilowatt, but you and the rig won't.

Petr, I couldn't find the document but the changes are so simple that I can relate them here. When the problem was first realized by Yaesu there were several suggested solutions to repair the problem and all of them were implimented and published in a TSB (Technical Service bulletin) I sent both the transceiver and the power supply to the local Yaesu service \tech and after 6 months waiting took it back. His excuse was he couldn't get parts from Yaesu. I obtained the TSB by devious means :-) and implimented the changes myself. They were as follows : 1,/ Install a Ground wire between the chassis of the transceiver and the PSU to stop circulating currents. I did this but it didn't do anything to the noise. Yaesu later tried a piece of conductive foam stuck between the two chassis. 2./ Add a ferrite choke to the power leads between the PSU and rig. ---Still too much noise.Actually it really didn't seem to do anything at all. 3./ Open up the power supply and you will see 4 large capacitors in the one corner. Look at the printed circuit side of the board. One capacitor is positive output line to ground and one capacitor is negative line to ground (The negative is not grounded but floats) Add a .03? or was it .33mfd?(Try for yourself) flat cap across each large capacitor (positive to ground and negative to ground)and one from Positive to negative. ---A total of 3 capacitors. I did this and the noise disappeared totally. There was another mod that I didn't carry out. It involved wrapping a broad strip of sticky backed copper tape around the windings of the two internal transformers and connecting a soldered on wire to ground all to act as a shield for the windings. I didn't feel it necessary to do this as the noise was gone. You have to unsolder the transformers to do the job. I didn't do it anyway. Thats all. Those large capacitors on the output has the noise just float right by on them and the small added capacitors are low impedance for the noise. It's an easy job to do. Just take care and remember there are internal pieces of plastic between the PCB and the metal for insulation. The switching transistors are also insulated from the chassis which is their heatsink so remember to slide their insulating material back in place when you re assemble. Good Luck. If you don't have success then get back to me here and I'll look for the info some more. I favor the little 1/4 wave ground plane verticals for that kind of use. You can hang it up at a safe distance on the end of 25 feet of coax and make the RF exposure more reasonable for yourself and the transceiver. You can build one of those with an SO-239 and four lengths of brass rod. Actually,if you are keeping it indoors you can substitute clothes hanger wire for the brass rod and be a bit more frugal.

Take 86 inches of insulated wire strip both ends and solder one end to the center conductor of a lenght of 50 ohm coax and the other end to the braided shield. You now have a real cheap full wave 2 meter loop you can place vertical in a square or round form to be bidirectional or flat to be an omnidirectional antenna.

Hi All,
I have a 2004 Chevy Avalance and will be installing my 897 and ATAS antenna, i'm looking for a floor mounted bracket, however i have looked at a few on the net and i'm not sure which model would be best, most of the ones i have looked at dont look to strong and i dont want the radio moving around with every bump i hit in the road,

do Ya'll have any favorites or could vouch for a model that can take the weight of the radio etc,

Also i'm a little worried about screwing through the floor with self tapping screws, i guess the best way would be to buy some real short self tapping screws so i dont fix into the transmission.....

All thoughts welcome

Thanks

27079. AT-897 Tuner with one touch not working

Yahoo group: FT897 (2009)
Date: 2009-07-30 06:21:40 UTC
From: Hussain (F)
Topic: 27079 Message: 27079

Hi, Dear All HAM

I wonder with some thing wrong unknown happened with my AT-897 attached
with my FT-897D, that is not working with one touch.

What i remember !!
Last month i detached all cables i.e. power cable, battery charger cable, Antenna cable,
link cable from AT-897 to FT-897, CAT/Linear cable from tranceiver to Tuner and One small
cable from ACC of tranceiver to OTT of Tuner.
and went for a small operation at an other location, but did not operate there.

I came back and installed every thing which i have detached.

Every thing is working except One touch operation of Tuner.

Tuner is working when i change by changing the mode to AM or FM and then pressing PTT then
tuner's push button.
while it was working before by simply pressing the tuner's tune push button.

I have checked the small ACC to OTT link cable, it is close/short,
the center pin of Black tuner side to middle pin of Red Radio side
and both outer point of both pins of this OTT cable.

I think it is correct by default.

Can not understand what happened, either ACC port of radio is not
giving signal to Tuner or Tuner's OTT port is not receiving.

One thing more, when i connect this cable from ACC to OTT, Radio
does not goes to transmit mode (i mean PTT not working) while,
when a attaches this cable during the power on /radio on position,
it immediatly goes to xmit and does not goes to receive mode.

Any help to eradicate the problem will be highly appropriated.

Good Luck and

Hello Jim,

Thanks a lot for your info. I really appreciate it.
In the meantime I was lucky to find a technical suplement document incl. schematics on the Internet. It gives a chance to do something about it.

> 1,/ Install a Ground wire between the chassis of the transceiver

I have a PSU version with conductive foam strips already.

> 2./ Add a ferrite choke to the power leads between the PSU and

My investigations indicate that the noise doesn't spread via the wires coming in/out, not via mains, nor 13.8V. Both of them are reasonably filtered.

> 3./ Open up the power supply and you will see 4 large capacitors in...

I will definitelly try this. Easy to do.

> It involved wrapping a broad strip of sticky backed copper tape

This sounds important to me. It looks that the RF noise spreads just from these two large ferrite transformers.

Recently I noticed that the PSU also produces an audible hiss. Before, this hiss occured for about one second right after the PSU was disconnected from mains. Now it is audible also when it runs idle.

Have a great day, 73, Petr, OK1FIG

27082. Re: Chevy Avalanche mounting

Yahoo group: FT897 (2009)
Date: 2009-07-30 09:44:52 UTC
From: kbrown1075
Topic: 27076 Message: 27082

I can not suggest a bracket, but I would like to bring a couple thoughts of waning: 1. If you are going to sheet metal screws, make sure you look closely under the vehicle before you drill or screw. We had an install person nick a wire hareness that ran to he transmission. It took many many visits to the shop to find the problem and was very costly. 2. Take into consideration that the floors of most vehicles are just pressed sheet meatal, they really don't have much thickness to them. The 897 has some weight to it and if the bracket has any hight it, will amplify the weight of the radio's movement as you travel and worse, if you had an accident. Sheet metal screws seem tight to today, but can take no time working them selves out or tearing the metal on thier way out. If you can, thru bolting with large washer may be a safer install (harder I know).

FYI- One of my jobs is the installation of radio's and computer mounts commercialy.

Good Luck.

Hello Wayne

When choosing the position for mounting your bracket, 2 things more you can consider,,,

Try a side mount in the foot well area of the Avalance, also consider using "pop rivets", or "Blind rivets" you can use washers with these, and it will prevent ever shaking loose.

If the bracket ever needs removing, all is needed is a quick shot with a re chargeable drill.

All other alternatives aside,,, don't forger to allow enough room for the cooling fan to do its work !

Regards _____ Peter EI4HX

Petr,
I too thought the transformers needed shielding but I didn't have to do it as the capacitors took care of the problem.
If you install the copper foil tape around the transformer windings then I don't remember if the tape ends should overlap. To my thinking, if they overlap then this would be considered as a one turn shorted turn and may cause overheating and maybe failure of the transformer. Anyhow it would be easy to leave a small gap on the top surface and seal across it with another strip of foil to see what happens.

You're looking for MH-59A8J

http://www.eham.net/reviews/detail/4898

They're all over EBay and there are a few on Google Shopping. The guys on EBay are obviously gaming the shipping price: charging less for the item and more for shipping. I absolutely refuse to buy from anyone who does that, so the safest bet is probably the direct sellers on Google Shopping.

DE N7UVL,
Vanity Call Sign processing takes a "back seat" to
other administrative functions. Which is one reason
the FCC periodically suspends processing entirely.
When the FCC begins to narrow down the "backlog"
on other "paper" work, they will again assign some
one to tackle the "Vanity Stack"./ga

27094. Re: [FT897] Microphone with DTMF tone buttons?

Yahoo group: FT897 (2009)
Date: 2009-07-31 19:33:17 UTC
From: Thomas Wilson
Topic: 27089 Message: 27094

It doesn't cost $30 to ship a microphone through the mail. I ended up buying one of those mics direct on the web (not through an EBay seller), and I paid about $8 to have it shipped. When I checked a few minutes ago, I saw 3 on-line stores selling that mic for between $72 and $75, and all were charging $10 to ship.

Now, the guys on EBay are charging $50 for the mic, which is a fantastic price! But they're tacking on a $30 shipping cost. They're basically selling the item at the wholesale distribution cost and taking their $20 profit in the shipping price. This means that they also save on selling fees, since EBay charges based on the item's price without shipping. The amount is about 70 cents. But if you sell 1000 items a month, 70 cents adds up to $700 pretty fast.

Here's what one seller told me when I asked him about it: "We shifted some cost to the shipping cost in order to save eBay fees and give a lower total cost (price + shipping cost) to buyers. So please kindly consider the total cost of this item. It is with a very competitive total cost."

Those were his exact words. The guy's name was Edwin Law, with the seller "hongkongdigi".

It is off topic for this Yahoo group, but ... the site http://www.ae7q.com/ will tell you what you need to know. The status of your application is at http://bit.ly/XQO2a That shows the prediction that you will be granted W4PHS. It also shows that your receipt date was July 23. Back on the site home page, scroll down to the table headed "Pending application prediction summary". In that table, you will see that applications with the receipt date of July 23 will be processed on August 11. If you click on the "Tue 2009-08-11" link you will go to a table of everything the FCC is expected to do with vanity applications on that day. Scroll down and you'll see what's going to happen to your application.

From: Hussain (F)
Topic: 27079 Message: 27098

Thanks Jim for a nice tip.
I have checked it again now the DIN on both side is ok.
further i tried to on the radio with out DIN and attached ACC/OTT cable.
it give me same response,like Rig went in to xmit mode when i push
the cable in female of ACC while it was on.
Again i switch off the radio, inserted the pin of OTT cable in the ACC port of radio.
switch on the radio, radio does not go in xmit mode , PTT not working.

i think, problem is in this OTT cable or in the radio ACC or OTT of tuner port.

Check out menu #26 on page 57 of the manual. That will give you an option to test part of the transmitter if you do not have a code key. The only other option I know of is a full reset. Make sure you record all memory information before the reset so you can reprogram the radio. There is no assurance that a full reset will help, if you have to send it to Yaesu for repair they will do a full reset and at lest you will have all of your setting so you can have an easer time reprogramming after repair.
Good Luck and 73s

KC4RSL:

You might also want to look at the BullDog paddles. I had a BullDog Mini Key for my FT-817 that I really liked. If you don't need it to directly plug into the mic port, these are real small and very survivable.

Just out of curiousity: do you have to turn on the mic keyer mode (where the up button sends a dah and the down button sends a dit), or does the keyer do all that internally?

27102. CW filter turns off all audio

Yahoo group: FT897 (2009)
Date: 2009-07-31 06:07:14 UTC
From: mikebenack
Topic: 27102 Message: 27102

Hi gang, this is my first post here. Been reading the posts for a few weeks now. Having a little problem with the YF-122 CN filter. When I select it in the multi function row N, all audio goes dead. I can still hear some receiver hiss if I turn up the volume but no signals at all. The installation was easy so I think I got that right. Been through all the other multi function and menu items and tried different settings but still no audio. Am I missing something here? This is the second filter. Sent the first one back thinking it was defective but the new one does the same thing. I hope it's me and not the 897D. I hope someone can tell me what I'm doing wrong.
Thanks

Date: 2009-07-30 13:50:54 UTC
From: voskiarzat
Topic: 27104 Message: 27104

Hi all,

I am new to this reflector, and a new owner of an FT-897D. I would like to send canned messages and use the paddles also when needed. CAT interface cable is attached to COM 7, using a SignaLink USB interface.
Have a CW interface cable attached to COM 6 with a Y adapter to the CW jack. The problem is, when I hook it up, it continuously keys the Transmitter until I press the [KYR] C button to disconnect the Keyer, and only then I can use the canned messages.
But then I can't use the paddles. I don't want to reach behind the rig and keep changing plugs.
Any solution or schematic to the problem?

73, Noel (OM) N3NZ

From: Thomas Wilson
Topic: 27104 Message: 27107

Here's the problem. You can't use the internal keyer and an external keyer on the key jack at the same time.

You can key using the PTT line on the data port; make a splitter: bring the PTT line over to your keying interface and run the audio lines to the Signalink. Since the Signalink uses a relay to key the radio, you can run the PTT wire to the Signalink and to your keying interface.

Whenever the radio is in CW mode (or any non-data mode with Auto CW turned on), the PTT line on the data jack will send a CW tone. In digital

You do not need anything but your paddle (and maybe a code key) connected to the key jack.

You installed it upside down most likely. I did the same thing when I first bought mine. I fired it up and said to myself "hey, this filter works AWESOME, all the noise is gone!". Then my senses came back to me after having left for a short while.

Tom.

Thanks and appreciate your reply to help.

I hope I am interpreting your instruction correctly.

The data cable from radio is attached to sigalink. Can I just

Connect the tip of the CW interface by splicing into the PTT line?

Leave the paddles connected directly to the CW jack.

Subject: Re: [FT897] Paddles and Canned Messages

Here's the problem. You can't use the internal keyer and an external
keyer on the key jack at the same time.

You can key using the PTT line on the data port; make a splitter:
bring the PTT line over to your keying interface and run the audio
lines to the Signalink. Since the Signalink uses a relay to key the
radio, you can run the PTT wire to the Signalink and to your keying
interface.

Whenever the radio is in CW mode (or any non-data mode with Auto CW
turned on), the PTT line on the data jack will send a CW tone. In
digital

You do not need anything but your paddle (and maybe a code key)
connected to the key jack.

Mike, are you using the Signalink USB (recommended)? If so the Siginalink supplies the cables. That is
if you purchased it from Tigertronics. Signalink USB only uses 2 cables. 1 one from acc port on radio to
Signalink USB interface. 2 One from Signalink USB interface to USB port on Computer.

GM all

First of all, I love the FT 897D but have to send it in when it stopped sending dashes from the CW plug in.

A while back there was a string about the 897 failing in CW around high RF fields. I prototyped an opto-isolator circuit and attacthed on the back of my rig. It has behaved very well include 2 field day operations. Now it is time for installing the opto-isolator circuit inside of the radio. I have developed a circuit assemply to be glue on the circuit board and jumpers for attaching this circuit to the main circuit board.

I am looking for someone to comment on this idea. I have several pictures available.

I have developed a procedure to do this and want comments on any posible problems that may be overlooked.

27120. Grounding the FT-897

Yahoo group: FT897 (2009)
Date: 2009-08-03 03:42:40 UTC
From: kj4nts
Topic: 27120 Message: 27120

I have two questions related to grounding my FT-897:

1. I have about a 50 foot run from the 897 to the ground stake. What is the minimum gauge wire that is acceptable for this?

2. My 897 has the FP-30 internal AC power supply. An ohmmeter check shows that the power line ground is connected to the ground point on the back of the radio. Is there any problem in having both the power line ground and a separate ground rod connected to the ground? I vaguely remember some electrical code that forbids more than one ground point for an electrical system in a home.

In my experience, there's no single answer to grounding problems, but
I do have the best luck when equipment is grounded at a single source.
There are several reasons to ground your equipment, and the reasons
can sometimes be mutually problematic.

I generally follow the "single ground" rule: I try to ground all my
equipment at one point, and I use ground-lifted cables or isolation
transformers for audio lines. The key is that each piece of equipment
is connected to ground at one source only.

In the case of your radio and antennas, you should look at what works
best. The most important issue, aside from safety, is probably
transmit interference. You don't want your radio in the phones, TV, or
stereo. After that, work on receive noise.

As far as the antenna ground goes, I believe the single-ground
requirement for the house is to make sure that all of the outlets are
connected to the same ground. Grounding your antenna doesn't affect
that, since your antenna is not connected directly to the AC mains.
(The usual applies: I am not an electrician, so don't sue me if I'm
wrong.)

DE N7UVL ($.02),
I believe when researching the grounding aspects,
you will find that all electrical devices at a location
need to be on the same "AC" electrical ground in
order to prevent possible ground loop potential
differences between devices. I don't think that
concept prevents additional grounding.
-Note: Before electrical codes were changed, I
was once shocked using an electric drill near
one of the old time room water radiators.
-RF grounding is "sometimes" a bit different. While
RF grounding may share the same path on a chassis
in modern equipment, this has not always been
the design on "vintage" equipment. Some vintage
equipment had chassis that were not actually grounded.
Sometimes even the antenna ground connection on
the back was not connected to the chassis. There
are circuit mods to bring these older pieces up to RF
& AC safety compliance. Unless those mods are put
in place, a vintage piece of equipment may have a
"Hot" (and unsafe) chassis./ga

The internal Yaesu FP-30 power supply connects the ground from the power mains to the radio chassis which, of course, is connected to the ground terminal on the back of the radio. So I will have two ground connections running to the radio: (1) the power line (mains) ground, and (2) my ground rod. The ground rod for the power line ground is at the opposite end of the house from my radio ground rod.

What gauge wire is required for a 50 foot run from the radio to the ground rod?

I have not yet connected the radio to my ground rod, so the only ground is through the power line. I am getting a great deal of transmitted audio pickup through my computer sound system. I am hoping a good earth ground rod will solve that problem.

This is where you experiment. :)

Is your computer connected to the radio (via a CAT cable or sound card interface?) Do you get noise in the speakers when you have the CAT cable and sound card interface disconnected? I had no luck with RF chokes; that's why I bought a Bluetooth adapter for the CAT cable and built an audio interface using audio transformers and an optocoupler.

Or you may need a better sound system. I recently had the same problem. Switching amplifiers solved the problem (I was running a 12 volt car stereo amplifier. I pulled it out and put in a home theater receiver.)

As to grounding the radio to your antenna grounding rod... the bigger the better, but I think you'll find that 12 or 10ga is the largest you can actually work with.

Hi,
As far as RF and grounding goes... the more conducting surface area of the ground wire the better. It is usually recommended to use a flat copper ribbon or heavy braid.

For a 50 foot run I'd think that using the ground shield of RG8 coax would probably work out fine for you since that gives a lot of surface area for RF to conduct on. No, you don 't need to separate the shield braid from the coax. Solder the braid to the center conductor at either end. Using regular house wire won't offer the same surface area.... RF likes to float on top of the conductor and the interior conductor material is pretty much useless.

You might be able to find a heavy braid for less $ per foot but the coax shield has some advantages as far as being insulated for a long run which offers some protection.

It would be a good idea to use a good AC voltmeter to see if there is any ground loop voltage between the rig (Plugged in) and the RF ground before attaching it to the rig.

My station uses a special type of wire called LITZ wire The only reason I'm using that is because I got it free Litz wire has hundreds of very small wires braided together which are insulated from one another. This type of wire conducts RF quite nicely at lower frequencies as well as having a good amount of current carrying capability in case of a lightening strike.

So far the consumer equipment around me has never been RF'd so no complaints from the XYL and that's a good thing!

Hope that helps. John KB0NE

I am not a licensed electrician, but for reasons not worth discussion here, I have become quite familiar with the residential portions of the National Electric Code, and done a lot of residential wiring work under the supervision of a licensed electrical contractor who held a PhD in electrical engineering.

Between that background and what I have learned from ARRL publications and elsewhere about transmitter grounding, I offer the following:\

1. Purely from an AC mains standpoint, the ground wire should be large enough to carry the entire current that can possibly flow through it if a dead short occurs within the equipment. If the circuit in question has a 20 amp circuit breaker, then the maximum current that could flow through the ground wire (before the breaker trips) is 20 amps. For a 50 foot run, #12 wire is sufficient from an NEC viewpoint. The NEC specifically allows grounding the "third plug" of a socket to a cold water pipe, for example, if a "system groundd" wire is not available at that location (for example in an older house where the wiring is only two conductor). But that is not the "driving issue."

2. From an RF grounding standpoint, it is desirable to have the largest possible wire size running the shortest possible distance between your shack and the ground stakes. Within the shack, best practice is a short (several feet) "grounding bar" of large diameter. I use a 2 foot section of 1.5" diameter copper plumbing pipe, drilled and tapped for 1/4-28 thread bolts, and all RF-carrying devices are grounded to that bar with 1" wide braided copper straps, 1 foot length. The grounding bar is connected to ground rods with 2/0 stranded wire (0.3648" conductor diameter). The first ground rod is a 5 foot run of 00 wire from the grounding bar, and there are four additional ground rods, spaced about 20 feet apart, connected in series to each other with 00 wire. The grounding rods are 1/2" copper rods, available at big box hardware and electrical supply stores. This is an adequate, but not great, RF grounding system.

The general rules for RF grounding are (1) shortest possible run from station ground to earth ground, preferably less than 1/4 wavelength on the highest frequency you'll be transmitting on. (2) Use as large diameter conductor as possible -- either large wire or large flat braid (or you can use the braided copper wire shielding from large diameter coaxial cable.) (3) Make sure all connections are properly bonded (clamped) and if exposed to weather, protected from corrosion. I use GE Silicon Bathroom Sealant to protect all bonding joints.

The reason you need much larger diameter wire for RF grounding is that inductive reactance increases with wire length, but decreases with

conductor diameter. Large diameter conductors help to offset the inductive reactance of long ground wire runs. If a run of ground wire is 1/4 wave length, or any odd multiple of a quarter wave length, for the frequency being transmitted, it will be, in effect, a ground-reversal device. There will be zero voltage at the ground stake, but whatever RF voltage is "available" to the system (from the transmission line, typically) will be at a maximum at the other end of the ground wire -- your transmitter! If the ground run is not exactly 1/4 wave length, you'll still have voltage at the transmitter end of the grounding system, proportional to the phase position of the signal on the ground wire. With the 100 watt output of an FT-897, RF voltages can be a problem from an equipment standpoint, but not likely to be lethal. With a full 1.5KW legal limit linear amplifier, you're talking about (under some circumstances) several thousand volts!

A 50 foot ground wire run is a horrible solution, because it creates 1/4 wave length multiples for so many frequencies. For example, it's very close to a perfect odd multiple of a quarter wavelength on 20, 15, and 12 meters, and it's an EXACT odd multiple of quarter wave lengths on portions of the 10, 6, and 2 meter and 70 cm bands. If you change the length slightly, you just shift the worst problems to other frequencies.

There is a detailed and very good discussion of the issue and possible fixes at http://www.radioworks.com/nbgnd.html.

In particular, if you really can't avoid a 50 foot run from the ground stake to your rig, don't bother running the ground wire. It will create more problems than you have without an RF ground. Your house lines will provide grounding for the 110/220 VAC house power, but you'll have to deal with the RF ground problem another way. Read his discussion of a counterpoise.

As for your question about multiple grounds within a residential system, the NEC does not prohibit multiple grounds. They can cause problems from ground loop current, but that's an RF issue, not a house mains issue.

In #2, the key phrase is "largest possible wire running the shortest possible distance." Remember that ANY wire used for ANY purpose (computer cables, speaker wire, ground wires, etc) become resonant at certain frequencies the longer they get. A 50 foot run of ground wire, IMO, is WAY TOO LONG! If you can shorten it in anyway, it would be best.

Tom,

Monday morning around 9:00am, tackled the project following your detailed instructions on how to (FIX) operate with the paddles and the CW interface. The work around was very successful. Now I am able to send canned messages F1 thru F12, and use the paddles when needed without pushing the buttons on [KYR] or [BK].

For others who are interested, I stripped the DATA cable about 2 inches midway between the radio and the SignaLink and soldered the CW interface signal to the RED wire, which is the PTT, and ground wire to the BROWN wire, which is GND.

The only observation I like to add, is looking at DATA Jack in the back of the transmitter, PTT is at 3:00 o'clock and the wire color is red. The Ground is located 7:00 o'clock and the color is brown.

Thanks again Tom, have a good day, and a better one tomorrow.

73, Noel (OM) N3NZ

From KD5LBE resending

In normal soil ground rods should be 8 foot copper clad steel. All rods at your house should be tied together to equalize any major lightening strike (code). Putting a ground rod down is easy with almost no effort. You need at least a two foot clearance above the rod. Dig a small hole no more that a couple of inches deep where you want the rod to go. Pour some water in the whole. put the sharp end of the rod in the hole and start churning the rod. up and down. As the rod goes down add a little more water. This should get you down at least 6 feet if not seven. What ever you have left should drive in with little or no problem. I put in many a rod with Memphis Light Gas and Water and at my house. You can even impress your friends with how easy it is. This doesn't work in rock, frozen ground, or rocky soil. This all assumes that you are at ground level looking for a grounding location. If you can't do this be sure to first by HAM radio insurance from the ARRL, and second to disconnect your radio and antenna in bad weather and have a surge protector on the power cord, the best you can afford. Grounding RF and Electrical are serious business. I have a friend in a wheelchair for life because he didn't take it serious.

I could put a surface wire counterpoise in the crawl space under my office where the radio is located. If I did that, there would be only about a 5 or 6 foot run to the center point of the counterpoise.

Assuming the counterpoise wires are laying on the dirt floor of the crawl space, how many wires would I need, and how long do they need to be. I want to be able to work 6 through 40 meters.

If I install a wire counterpoise like this, is there any problem also connecting the earth ground connection to the central ground bar in my office?

The attic antenna is an Alpha Delta DX-EE.

The counterpoise NEEDS to be separate from your equipment ground. Again, because your counterpoise is a LONG wire that runs around the house, it is going to be resonant at some HF frequencies and act like an antenna and if tied/connected to your equipment ground, it COULD pose rf problems.

The idea behind equipment grounding is twofold; one to reduce/eliminate rf getting into your equipment, and two, also to assist in reducing/eliminating damage to your equipment from lightning strikes.

The first is why the wire should be as short as possible, the second is electricity travels the path of shortest and least resistance. So, having the shortest grounding wire, helps to ensure proper elimination/reduction of rf and electrical damage.

Subject: [FT897] Re: Grounding the FT-897

I could put a surface wire counterpoise in the crawl space under my office where the radio is located. If I did that, there would be only about a 5 or 6 foot run to the center point of the counterpoise.

Assuming the counterpoise wires are laying on the dirt floor of the crawl space, how many wires would I need, and how long do they need to be. I want to be able to work 6 through 40 meters.

If I install a wire counterpoise like this, is there any problem also connecting the earth ground connection to the central ground bar in my office?

The attic antenna is an Alpha Delta DX-EE.

From: kj4nts
Topic: 27120 Message: 27133

I understand and agree with both of your points. However, short of moving to a different house, I have to live with the limitations of my home geometry.

There is no way to get from my office to the outside ground without a 50 foot run.

An outside buried counterpose would be extremely difficult. We have many buried wires for sprinker systems, low and high voltage outside lighting, phone, alarm, and cable connections fanning out from the side of the house where the counterpoise would have to start. I can get between the wires to drive ground stakes, but if I start digging long trenches I am going to cut many wires. Also, even if I used an outside counterpoise, it would be a 50 foot run to get from the FT-897 to it.

So, an alternative is to lay wires on the dirt floor in the crawl space under my office and try to form a counterpoise that way. But if I do that for an RF ground, I would still like to have a connection from the FT-897 to a good earth ground for lightining and general safety reasons.

If it helps, I can lay the 50 foot wire running to the ground rod directly on the dirt floor. Maybe the close proximity to the ground would add RF grounding to the long ground wire.

If I construct a radial counterpoise in the crawl space, how long do the radials need to be to handle 6-40 meters? And how many radials are needed?

I completely concur with Dennis that a 50 foot ground wire is far too long for RF purposes. The goal is to use as short as possible a ground wire between the shack and the rig, knowing that the longer the wire, the more ham-band frequencies will be 1/4 wave resonant. Shortening the wire is far more significant than increasing its diameter.

The only purpose of a larger diameter wire is to reduce the inductive reactance for whatever length of wire you are running, but larger wire is not a substitute for a short wire run.

A calculator is available online at http://www.consultrsr.com/resources/eis/induct5.htm to calculate the inductive reactance of a straight piece of wire of a given diameter and length. To take two examples, #14 wire has a diameter of 1.62814 mm. A run of 15 meters (appx. 50 feet) has an inductance of about 29.2 µH. Changing the diameter to 2/0 wire (9.25 mm diameter) reduces the inductance to 26 µH -- a little help, but not much.

On the other hand, a 1.5 meter (10 times shorter) run of #14 wire possesses inductance of about 2.2 µH, and a 1.5 meter run of 2/0 wire only 1.7 µH. Thus, a 50-foot run of #14 wire will have 13 times as much inductance as a 5 foot run of #14 wire, and 17 times as much as a 5 foot run of #00 wire, which means the longer wire has the potential to create up to 17 times as much voltage at the rig as the shorter wire, not even counting quarter-wave issues. The increase in inductance is not a linear function of wire length. The formula is :

In this equation, L is the inductance in nH (10-9 henry), l is the length and d is the diameter of the wire/rod (both in cm). µ is the permeability of the material (=1.0, except for iron and other ferromagnetic materials).

You can work through the formula if you wish, but a simple demonstration with the online calculator shows the effect. Holding all other factor equal, here are the inductance numbers for #14 wire at various lengths:

1 meter = 1.4 µH
10 meters = 18.7 µH (10 times length gives 13.4 times inductance)
15 meters = 29.3 µH (15 times length gives 21 times inductance) (this is your 50 foot wire)
100 meters = 233 µH (ten times length gives 12.5 times inductance and 100 times length gives 166 times inductance)

changing the wire size to #00 provides a little relief:
1 meter = 1.06 µH
10 meters = 15.2 µH

100 meters = 197.6 µH

As you can see, wire length is VASTLY more significant than wire diameter.

To compound the problem, inductive reactance as a direct function of frequency. (the formula is

This says that if you quadruple the frequency, inductive reactance increases fourfold, Thus, RF energy imposed onto the ground wire at 28 mHz will encounter 4 times the inductive reactance as energy at 7 mHz. This means that (setting quarter wave resonance issues aside) you'll get four times as much voltage drop over the wire and four times as much voltage at the rig on 10 meters as you would on 40 meters.

The problem is compounded by the higher probability that a longer ground wire will be quarter -wave resonant as you move to higher bands. Voltage at the rig is maximized at quarter-wave resonance or odd multiples thereof. a five-foot wire is fairly close to quarter-wave resonance on the six meter band, and the third multiple on 2 meters. Hmmm. I should look carefully at my setup. A wire run of either 4 feet or 6 feet would move the resonance points outside of ham bands. I think the distance of the ground stake above ground counts, so my 5 feet of 00 wire plus a foot of ground stake is less problematic than 5 feet between the rig and ground itself. Dennis, do you concur?

All of which is intended to reinforce the point that -- as Dennis said and I agree -- a 50 foot run of ground wire is 'way too long.

Dennis is also correct that the NEC says that in general, all grounding rods should be tied together, but the NEC does make some exceptions. Best practice is to tie them all together.

And yes, I have lightning arrestors build into the antenna system to carry the energy from lightning strikes on the antenna directly to ground. Living in Southern California, where we almost never have lightning, I forgot to mention that issue, but it's of real concern in most parts of the country.

The short answer for counterpoise construction is a separate wire cut to 1/4 wavelength or slightly longer for each band on which you're operating. They can be run around the edge of a room, under carpets, or in a crawl space, parallel with each other so long as they are not actually touching each other (or are insulated). You can get by with eliminating a few wires, because (for example) 80 meters is the third multiple of 30 meters, and 40 a multiple of 15 meters.

KJ4NTS,

I don't think that you need a *counterpoise* at all, because you are using an Alpha Delta DX-EE, which is a fan dipole. Dipoles are balanced. Counterpoises are used with monopole (vertical) antennas to provide the other half of the antenna, in effect.

Do you have high resistivity soil? If so, you may want to put radials down to improve ground return. I would not call this a counterpoise. In this case the radials would connect to (RF) ground. These should not be buried, just at ground level. They can even be stapled to the lawn or soil.

If your antenna is not working well, you want to move it out of the attic, if possible, and up a half wavelength above everything. That is the ideal. In reality, you can only do your best.

Do make sure your station is safe. This includes lightning protection and making sure RF levels are safe in your home (and your neighbors'). Since there is a '4' in your call, you probably need lightning protection. I have done this, even though we don't get many thunderstorms here.

Just a few more thoughts from reading posts ☐ counterpoise does no good if it is buried! RF cannot penetrate the ground! Burying your counterpoise defeats the purpose of having it. It is like a shunt, it is supposed to pick up ☐stray☐ RF (so to speak) and remove it from ☐inside☐ the loop ☐shunting☐ it to ground and away from electronics.

Your counterpoise should be around the OUTSIDE of your home, around the foundation, if you want it to work the way it should. Under the home is defeating the purpose again. Laying it on the ground is ok, but if you could prop it about an inch off the ground helps.

For those who may live in a mobile home (ANY YEAR) ☐ IT MAKES NO DIFFERENCE!!! The home STILL NEEDS that counterpoise!

My grounds have always been #10 or #8 SOLID WIRE run from the strap on the back of my home built radio shelving (all wood) to the outside ground rod directly under the window from my shack. The run was about 12 feet (a little longer than I wanted, but, like was stated, gotta make the shortest run).

Remember that the longer your wire, you are creating an antenna that will be resonant SOMEWHERE! If for HF, try to stay under 15 feet for best results. However, as I stated before, the shorter the wire, the better.

Because I do not know what type of housing you are in (Actual house, condo, apartment, etc), couldn☐t you put your shack closer to an exterior wall that would help shorten your run of wire? How about the basement?

Now, that said, you can try this: Take some RG-8 and use the center conductor for your ground. Take the shielding and use that to ☐ground☐ the ground. The shield should trap stray RF and remove it from the center ground. YES, both center and shield must be separately grounded. When you fray the ends, DO NOT go more than a few inches up from the ends of the coax! That may work for a ☐long☐ run and help keep RF at bay!

As far as the rod is concerned, A few inches high is good enough. By ☐a few☐ I mean 2 to 6 inches. The majority of the rod should be in the ground to maximize dispersal. You only really need 2 to 4 inches to connect the ground wire to the rod, so having a foot or two out of the ground is a waste, IMO.

Hope this helps!

Dennis - N8BMB

I completely concur with Dennis that a 50 foot ground wire is far too long for RF purposes. The goal is to use as short as possible a ground wire between the shack and the rig, knowing that the longer the wire, the more ham-band frequencies will be 1/4 wave resonant. Shortening the wire is far more significant than increasing its diameter.

The only purpose of a larger diameter wire is to reduce the inductive reactance for whatever length of wire you are running, but larger wire is not a substitute for a short wire run.

A calculator is available online at http://www.consultr
<http://www.consultrsr.com/resources/eis/induct5.htm>
sr.com/resources/eis/induct5.htm
to calculate the inductive reactance of a straight piece of wire of a given diameter and length. To take two examples, #14 wire has a diameter of 1.62814 mm. A run of 15 meters (appx. 50 feet) has an inductance of about 29.2 µH. Changing the diameter to 2/0 wire (9.25 mm diameter) reduces the inductance to 26 µH -- a little help, but not much.

On the other hand, a 1.5 meter (10 times shorter) run of #14 wire possesses inductance of about 2.2 µH, and a 1.5 meter run of 2/0 wire only 1.7 µH. Thus, a 50-foot run of #14 wire will have 13 times as much inductance as a 5 foot run of #14 wire, and 17 times as much as a 5 foot run of #00 wire, which means the longer wire has the potential to create up to 17 times as much voltage at the rig as the shorter wire, not even counting quarter-wave issues. The increase in inductance is not a linear function of wire length. The formula is :

In this equation, L is the inductance in nH (10-9 henry), l is the length and d is the diameter of the wire/rod (both in cm). µ is the permeability of the material (=1.0, except for iron and other ferromagnetic materials).

You can work through the formula if you wish, but a simple demonstration with the online calculator shows the effect. Holding all other factor equal, here are the inductance numbers for #14 wire at various lengths:

1 meter = 1.4 µH
10 meters = 18.7 µH (10 times length gives 13.4 times inductance)
15 meters = 29.3 µH (15 times length gives 21 times inductance) (this is your 50 foot wire)
100 meters = 233 µH (ten times length gives 12.5 times inductance and 100 times length gives 166 times inductance)

changing the wire size to #00 provides a little relief:
1 meter = 1.06 µH
10 meters = 15.2 µH
100 meters = 197.6 µH

As you can see, wire length is VASTLY more significant than wire diameter.

To compound the problem, inductive reactance as a direct function of frequency. (the formula is

This says that if you quadruple the frequency, inductive reactance increases fourfold, Thus, RF energy imposed onto the ground wire at 28 mHz will encounter 4 times the inductive reactance as energy at 7 mHz. This means that (setting quarter wave resonance issues aside) you'll get four times as much voltage drop over the wire and four times as much voltage at the rig on 10 meters as you would on 40 meters.

The problem is compounded by the higher probability that a longer ground wire will be quarter -wave resonant as you move to higher bands. Voltage at the rig is maximized at quarter-wave resonance or odd multiples thereof. a five-foot wire is fairly close to quarter-wave resonance on the six meter band, and the third multiple on 2 meters. Hmmm. I should look carefully at my setup. A wire run of either 4 feet or 6 feet would move the resonance points outside of ham bands. I think the distance of the ground stake above ground counts, so my 5 feet of 00 wire plus a foot of ground stake is less problematic than 5 feet between the rig and ground itself. Dennis, do you concur?

All of which is intended to reinforce the point that -- as Dennis said and I agree -- a 50 foot run of ground wire is 'way too long.

Dennis is also correct that the NEC says that in general, all grounding rods should be tied together, but the NEC does make some exceptions. Best practice is to tie them all together.

And yes, I have lightning arrestors build into the antenna system to carry the energy from lightning strikes on the antenna directly to ground. Living in Southern California, where we almost never have lightning, I forgot to mention that issue, but it's of real concern in most parts of the country.

Dennis:

I'm going to disagree with you in some ways, but do respect your comments. This has to be one of the most difficult areas of the technology for Hams and there's so much conflicting information out there I don't know how anyone can make sense of it all. So, I'm sure some of my comments are also not going to ring true with many people on the list.

First off. I had a sign at Dayton this year that eventually was mostly erased by the rain (perhaps that should have been a clue). It said "When is a Ground Not a Ground?" The answer to that, of course, is "When there's current!". I think it's helpful for everyone to keep that in mind and that this incontrovertible fact should guide us when we're talking about what is commonly termed an "RF Ground". In essence, there is no such thing, so we need to accept that and look at how we can deal with stray RF issues.

The other thing is that your antenna includes anything attached to it that conducts RF or is close enough for some significant energy to be coupled into it. I believe it's important to keep this in mind and make a conscience decision as to what you want to be part of your antenna and what you don't want to be part of your antenna. Once you make that decision, everything else should be configured to NOT conduct RF or at least to have minimal RF coupled into it.

The direction I'm headed with this is that if you decide that your transmission line, your radio equipment, and your house wiring is not part of your antenna, then handle that accordingly. This means measures to avoid the RF being coupled into those conductors or being conducted by them. If you accept that you can't simply drain stray RF to some magical ground point, and that you can only minimize the effect of it at some location (i.e. using one of the tuneable ground devices), then nearly all such "RF Ground" measures become moot. This is because it doesn't matter what you do, it will be a totally different situation at another frequency and you'll be chasing it again later. The alternative of avoiding the RF in the first place starts to make more sense.

I also want to take the opportunity to differ with you on buried counterpoises (actually part of your antenna). The earth is not simply impenetrable by RF. If it were, many large MF an HF broadcast sites wouldn't have buried counterpoises. That's a whole other discussion though.

Youy need to read this article. COunterpoise works with dipoles too

http://www.hamuniverse.com/grounding.html

Here is part of what Bill says in that article, but go to the website
and read the whole thing

Years ago I installed a long wire antenna that was about 250 feet long
and about 50 feet in the air. This should work fantastic you say. I
had three ground rods outside window of shack with single ott solid
copper ground wire direct to tuner. Ground wire length was only six
feet. All three rods were spaced about eight feet apart with
connecting bare wire interconnecting them....in other words, a really
good surge ground. What I did not realize at that time was how lousy my
RF ground was. We could not tune the antenna on most frequencies and we
kept getting zapped from the radio or microphone when we transmitted.
Also, our signal reports were lousy. SO, after consulting some experts,
I added 250 feet of counterpoise around the building consisting of some
bare 6 gauge copper wire I had. The radio was on while I rolled it out
and a friend was listening to the broadcast on 40 meters, (OK it was
night time---best time to do antenna work right!) Anyway he reported
the broadcast was only about S 4-5 on meter. As I rolled out the
counterpoise it rose to 40 over S9 and came in much clearer. We were
able to tune everything easily now and SWR was rock stable. When we did
a signal test, the station we had talked to before accused us of running
a contest amplifier. We could not convince them it was only 100 watts,
same as before and the same antenna!

27140. COUNTERPOISE vs R F EARTH

Yahoo group: FT897 (2009)
Date: 2009-08-04 00:00:57 UTC
From: P Grant
Topic: 27140 Message: 27140

Hello all,

I've just finished reading all 16 posts on the changing subject of RF Earthing and Counterpoise.

I note that in some areas it seems to be allowed that the HOUSE Mains EARTH, can be used as the STATION EARTH !!!

I have a different view of things, and I cannot think how the two subjects can be read as going hand in hand.

First difference ,,, In my shack, all my radio equipment, amplifiers, computers, ect. are through a separate run of 10 Sq T & E [pvcpvc] cable,,, That is P and N, are 10 Sq, and the earth conductor is 6 Sq.with no insulation.

That is the quality of cable used to connect from your meter to your domestic breaker board.

I have a 60 Amp RCBO with 30 ma protection on the board,, and a 45 amp MCB in the shack, which is my main "off" switch.

I have a 3KWatt isolating transformer, connected, and a row of 220 V outlets to supply all my radio stuff. I use NO mains earth, all my equipment is bonded to my Shack "EARTH"

I am on the first floor, bench is 3 feet above the floor.

I have a half inch copper plumbing pipe feeding out to my buried earth spike which is in turn connected to a copper hot water cylinder buried about 4 feet below ground.

All the joints are soldered and so is the connection to the old copper cylinder !. I have a 3 ft piece of plunbing 3/4 inch diameter and all metal cased equipment, is bonded to this inside the shack. That is 13 feet from the ground to the inside of the shack, and the start of the 3/4 piping.
I thankfully, have no RF on the house hold "mains"...[touch wood]

I am lucky that all my antennas are pretty good, and I have little or no RF coming back in, through any co-ax,,, I also have a good electrical path for lightning conduction,,,, I was actually struck by lightning, while holding up a TV antenna while sitting on the roof,,, I felt nothing,,, but my mate who was watching could not believe it.... it was a dry summer day !!

I found my 3KW isolating transformer about 20 years ago,,, it came as "scrap" from some hospital equipment. New ones, [220 / 220] popular in the building trade, for equipment which cannot be had as low voltage [110VAC] cost around ?50.00 and are well worth having.

Our domestic household mains is 220-230VAC, and I have a couple of power supplies which are 110 VAC, and run perfectly through a 2 KWatt "Builders yellow box". run off the isolating transformer 220 VAC output.

I did have a RFI problem when transmitting on 50 MHz,,, buzzing on the PC speakers, and cured that with ferrite rings from a computer PSU. I also had TVI on 70 MHz, and cured that with a coiled co-ax balun at the antenna.[5 turns of 8 inches]

I hope this is some help, and I also hope when I send this,,, well; Murphy says,,,,,

..... sorry for going on so long!!!

Jim:

You do realize that these are very different situations. In the case of the DX-EE, it is the entire antenna, or should be. In the case of the long wire, that is only 1/2 of the antenna (presumably end-fed) and does require the ground, counterpoise, or whatever you want to call it to be a complete antenna. In that case, the counterpoise was clearly inadequate until it he added more wire. Applying that story to the DX-EE would require disconnecting nearly half of the antenna, then comparing results with that part added back in.

To Me, A ground is a ground at the resonant frequency AT the SET. A counterpoise has to be elevated as it is a tuned length.
If a counterpoise is 1/4 wave long (tuned) then the nearby connection to the rig is at a current high or max.
If you let the far end of a counterpoise get grounded, then the near end reverts to a voltage max and your rig is at high SWR condition . At this point the microphone can be RF hot and your lips get sparked --------Ouch! RF burns can take months to heal and into the bargain you have to explain why your lips look as if someone else bit them.
On 10 meters, an 8 ft GROUND wire (grounded at the far end) is actually putting the rig at a voltage peak and the SWR is high.
The only effective "ground" in this case is to have multiple lengths to different points otherwise have an elevated tuned counterpoise that is tuned by observing the SWR. Now if the Counterpoise is a 1/2 wave long the far end SHOULD be grounded. People who drag a so-called counterpoise behind them as they operate "Pedestrain " deserve to have it stomped upon.

Jim:

I think you miss the point. Your rig and your transmission lines should NOT BE PART OF THE ANTENNA SYSTEM. You need to look at isolating RF from anything but what you decide is your antenna system.

Hello Dear Jim

Sorry for late replying, it was due to absent from the home qth.

Thanks a lot for the helping me to eradicate the tuning problm
of my FT897
I have checked the menu # 26 , there tow options eleckey and mickey. i ahve selected
eleckey, there is no efect with both options.

So for the parts testing is concern with menu # 26 , i have not the code.to test the aprts.

I did full reset the transceiver , there is no efect.

Further, i oserved that the transciever immediatly goes to tx mode when i insert the pin
into
the ACC port if the tranceiver is on. and do not goes to tx mode if inserted off position.

waiting for

27147. FT897 Clock shift circuitry?

Yahoo group: FT897 (2009)
Date: 2009-08-05 07:10:10 UTC
From: Geert Jan de Groot
Topic: 27147 Message: 27147

The FT897, like most Yaesu rigs, has circuitry to shift the clock
of the processor on the main board. This is supposedly done to
move shift birdies, from the processor circuitry, out of the
receiver passband.

But, unlike other Yaesu kit, the 897 doesn't have a menu option
to adjust this, so the setting is either automatic, or the
hardware isn't driven by the firmware.

Has anyone investigated this? I do note that not only is the circuitry
on the diagram, the components are placed on my 897D - if the software
would not have supported this, it would have been easy to simply not
place the transistor et all during board assembly.

Secondly - on the front panel PCB, jumpers exist to change the
'meter' jack on the bottom from PWM (which is that we use),
to three other analog ports on the front panel CPU.
Does anyone know what that is for?

73,

Geert Jan

27148. CW tone very "Fuzzy" / distorted odd sounding.

Yahoo group: FT897 (2009)
Date: 2009-08-05 16:23:36 UTC
From: Victor Ward
Topic: 27148 Message: 27148

The CW tone of my FT897 has developed a very "fuzzy" sound, almost as if the speaker is rattling, I have the sidetone set at the default setting, seems to get worse as I get close to zero beat.
Compaired to my FT817 and Knwd TS570-D it is a rather harsh raspy note.
Speaker shows no evidence of this distortion on voice modes, sounds perfect even at relatively high volume.
Anyone else experience this? Anyone know of a fix?
Would appreciate any advice.

I once served in a foreign military.
We used portable HF for a lot of field work and the radio operator had either a small hip style rig similar to the 817 or a RAcal 931.
Instead of a counterpoise, the set had a piece of fly screen wire about 6" X 10" and enclosed in a piece of canvass which he tucked in his belt or put in his back pocket. The screen was connected to the Ground stud of the rig via a short wire. The screen acted as a plate of a capacitor and coupled the set to the operator who I suppose acted as a ground plane.
When the operator would get too far off frequency, SWR would increase and the screen would ZAPP the guy in the rear and remind him to retune.
It was understood NOT to put the screen under your belt in the front of your pants.
This idea was patented by Racal Electronics so it must have some desrability. Operators claimed longer ground wave distances for contacts. I still have one of these in my junk box. If anyone wants a picture, ask.

If I did that, there would be only about a 5 or 6 foot run to the center point of the counterpoise. Assuming the counterpoise wires are laying on the dirt floor of the crawl space,how many wires would I need, and how long do they need to be.

Hello

I read your original post and assumed that, like me, you were on an upper floor hence inconveniently far from the nearest ground, by which I mean soil,substrate,planets crust etc.

Then I read all the rsponses from the many members, all of whom made perfect sense. All of whom I believe to be correct in various different scenarios. Some of which I have used myself with varying degrees of success. It always amazes me the ammount of knowledge combined in these groups and many of my problems have been solved this way. A news group often gets across what a book just can't.

Then I read the part of your post at the head of this message and wondered if we'd all missed a tiny possibility.

Now if I'm reading it correctly, your radio is in a ground floor office. That office floor is but 3 feet above the "dirt floor of the crawl space" (ie the substrate beneath your house).

Or to put it another way you have not a 50 foot but a 6 foot run to the nearest possible earth point. Drill, lift, ease asside or just plain vaporise that office floor and knock in some earth rods.

Or have I read it wrong? Unless that "dirt floor of the crawl space" is actually atop one of those dreadful one piece concrete rafts that modern builders love so much then you don't got no excuse. Get drilling.

Regards

Subject: [FT897] Re: Grounding the FT-897

I once served in a foreign military.
We used portable HF for a lot of field work and the radio operator had either a small hip style rig similar to the 817 or a RAcal 931.
Instead of a counterpoise, the set had a piece of fly screen wire about 6" X 10" and enclosed in a piece of canvass which he tucked in his belt or put in his back pocket. The screen was connected to the Ground stud of the rig via a short wire. The screen acted as a plate of a capacitor and coupled the set to the operator who I suppose acted as a ground plane.
When the operator would get too far off frequency, SWR would increase and the screen would ZAPP the guy in the rear and remind him to retune.
It was understood NOT to put the screen under your belt in the front of your pants.
This idea was patented by Racal Electronics so it must have some desrability. Operators claimed longer ground wave distances for contacts. I still have one of these in my junk box. If anyone wants a picture, ask.

I used a variation on this in one of my QTH. I applied brick layer's copper flashing to the below grade, inside surface of all exterior concrete walls in my ham shack. It produced a capacitive path with 1 ohm reactance (as I measured it) to ground at 3 mhz. It behaved almost as a Faraday shield in the shack and I never had RF in the shack after that.

27155. Good CAT-software for FT-897 ??

Yahoo group: FT897 (2009)
Date: 2009-08-05 19:02:06 UTC
From: cergender
Topic: 27155 Message: 27155

Hello!

I have tried FTBCAT, Hamradio deluxe and Virtual Legacy Radio.

The best and the most practical for my purposes would be VirtualLegacyRadio. But I cannot get it working perfectly.
For example I cannot add any frequency in it permanently. It stays there only that long as the program is running and the next time I start it I have to add it again. There are also some freezing problems with it.

I am using WinXPPro.

Is there any other useful software around which you could recommend?

Ben

Like you my QTH is on the last floor (4th floor) of a building. I intend to use a mobile antenna (Hustler) with the metal parts of my balconny as counterpoise. About the grounding of my brand new FT897D what would be your suggestions as I can't direct a grounding wire to the ground (too high) and the co-owners of the building would not agree and I do not want also to disturb them with QRM.
Regards to all and many thanks for this very interesting link.

27158. FT-897D tuning ATAS 120

Yahoo group: FT897 (2009)
Date: 2009-08-02 21:49:02 UTC
From: jcsgoating
Topic: 27158 Message: 27158

I don't think this is an ATAS problem. It has happened a few times since I bought my 897D and ATAS 120.

My radio is mounted in my truck and I normally keep it on 14.300Mhz. When I travel far, I will change to other bands. Radio is great and have no real problems.

Every now and then I exercise the ATAS 120 by going to the different bands and tuning the antenna.

Today (it has also done this in the past), when I press the "A" "Tune" button, the display kicks to 14.223Mhz and tunes at that frequency. I then changed bands and the same happens. It does not matter what band I'm on, when I press the tune button, the display kicks to 14.223Mhz and tunes that frquency.

The only way I have found to stop this is to reload my saved settings using the Yaesu programmer. After I have loaded my saved settings all works fine and I have no problems.

This has happened about 4 times in the year I've had the radio. It's not a big pain but I would like to know what is causing this.

Try DXLab, a free-ware suite of eight applications that can operate independently, but detect each other's presence and interoperate automatically. Besides the usual transceiver control, logging, DX spot collection and digital mode features you'll find in most applications, DXLab,

- provides 10 banks of 10 memories, with the ability to continuously scan a bank's frequencies

- displays frequency-dependent settings for devices like tuners, amplifiers, and antenna switches, with optional control via parallel port signals

- supports transverters for 6m, 4m, 2m, and 70cm operation

- provides user-defined transceiver control sequences initiated by buttons (up to 16) and sliders (up to 8)

- controls up to 4 transceivers, with optional transceiver selection by frequency

- provides both map-driven and callsign-driven operation of most commercial PC-controllable rotators

- tracks confirmation and verification of QSOs for DXCC, TopList, and WAZ awards, highlighting needed DX spots, automatically generating outgoing QSLs that request confirmation of needed QSLs, identifying confirmed QSOs for submission to the ARRL DXCC desk, and generating DXCC submission paperwork

- reports progress towards DXCC, TopList, Challenge, VUCC, Marathon, WAS, WAC, IOTA, WAZ, WPX, USA-CA, Canadaward, DOK, WAE, WAB, DDFM, SRR, RDA, WAJA, JCC, JCG, and AJA awards

- extracts address information from all 3 CDROM callbooks and QRZ.com (free with advertising, or no advertising with subscription)

- provides one-click access to more than 80 web-accessible sources of QSL information (Pathfinder)

- directly prints QSL labels and 4-to-a-page QSL cards

- directly prints addresses on envelopes or labels

- provides operations that can alter many logged QSOs simultaneously without requiring the user to modify ADIF files -- e.g. performing callbook lookups on already-logged QSOs, or adjusting the start times of QSOs logged during a specific time range, or extracting QTH information from COMMENT fields, or...

- synchronizes with LotW and eQSL.cc, initiating upload and download operations with a single mouse click without requiring the user to manually invoke TQSL or manually download and import files

- captures DX spots from up to 6 sources (telnet clusters, packetclusters, DX Summit), creating and maintaining a local database with one entry for each active DX station that is color coded by "need", LotW, and eQSL AG participation, and whose entries can be independently filtered and displayed in a table, on its world map, and on a zoomable bandspread

- optionally announces needed DX spots, and includes a web server that makes all spots browser-accessible from anywhere on your home network, with support for smartphone access

- extracts QSX frequencies from DX spot notes, enabling accurate transceiver setup for split frequency operation with one user action

- captures solar and geomagnetic data from WWV spots and uses this data to display easy-to-understand QST-style graphical propagation forecasts, and to depict the auroral oval on its world map (choice of VOACAP, ICEPAC, or IONCAP propagation forecasting engines, all of which are included)

- monitors user-specified NCDXF/IARU HF beacon schedules to rapidly calibrate propagation forecasts with actual propagation

- decodes all PSK31 or PSK63 or PSK125 QSOs within your transceiver's bandpass and extract callsigns to create and maintain a "stations heard" window

- simultaneously runs soundcard RTTY (using the MMTTY engine) and an external modem (e.g. a KAM or PK232) to provide diversity decoding or the ability to simultaneously decode a DX station and callers

- supports PSK, RTTY, CW (generation only), and Phone (voice keying) with a single user interface and macro facility

- interoperates with MultiPSK, MMSSTV, MMVARI, MMTTY, MixW, Fldigi, DM780, HRD, DX Atlas, and CW Skimmer

- is updated frequently, and downloads/installs upgrades with a single mouse click

- is driven by an active and friendly user community open to everyone

DXLab is available via

<http://www.dxlabsuite.com/download.htm>

73,

Dave, AA6YQ

Check to ensure that you did not somehow turn on the split freq operating mode (The display would show split, or check the function button row and make sure that SPL doenst have [] around it show it is on). The symptoms you mention sound like it is active in which case no matter where you change the frequency to in VFO-A when you transmit it will transmit on VFO-B (That includes the tuning cycle). You can also prove it by going to VFO-B and changing that frequency and try it again, it should now tune on the new freq you set in VFO-B

There are two memory areas in the FT897 QuickBankd and Main.
Hope this helps
From the manual.....

QMB (QUICK MEMORY BANK) CHANNELS
The "Quick Memory" Bank provides one-touch access to
frequencies you want to store and recall in a hurry. You may
store a "QMB" channel into a "regular" memory later, if
you like; use of the "regular" memories will be described
later.
QMB Channel Storage
1. Tune in the desired frequency and set the operating mode
and bandwidth. If this is an FM channel, set up any re-
quired CTCSS/DCS and repeater shift configurations.
2. Press and hold in the V/M key until a double "beep" is
heard. The second beep provides audible confirmation
that the data has been stored into the QMB memory.
Pressing the [A](STO) key momentarily while
in Multi Function Row "c" [STO, RCL, PROC]
will also store a frequency into the QMB register.

QMB Channel Recall
1. Press the [F] key momentarily, then rotate the MEM/
VFO CH knob, as needed, until Multi Function Row
"c" [STO, RCL, PROC] appears on the display.
2. Press the [B](RCL) key momentarily to recall the QMB
memory. "QMB" will appear at the upper left corner on
the display.
3. Press the [B](RCL) key once more to return to the previ-
ous frequency (either a VFO frequency or a Memory
channel).
If you move the DIAL knob or MEM/VFO CH
knob while in the QMB mode, you can change
frequencies as if you were in a "VFO" mode.
You also can change operating mode by pressing the
MODE( ) or MODE( ) key. When this is done,
"MTQMB" will appear in the display, where "MT" repre-
sents "Memory Tuning." Press the [B](RCL) key once
more to return to the originally-stored QMB frequency.

...**
MEMORY OPERATION ON
"REGULAR" MEMORY CHANNELS
Most Memory operation will be conducted in the "regular"
memory registers. There are 200 memory channels avail-
able for storage and recall of important frequencies.
Normal Memory Storage
1. Tune in the desired frequency, and set the operating mode
and bandwidth. If this is an FM channel, set up any re-
quired CTCSS/DCS and repeater shift configurations.
Standard (default) repeater shifts do not require you to uti-
lize the "split" frequency memory technique, described later.
2. Press the [F] key momentarily, then rotate the MEM/
VFO CH, as needed, until Multi Function Row "b" [MW,
SKIP, TAG] appears on the display.
3. Press the [A](MW) key momentarily to enter the
"Memory Check" mode, which is used to find an unused
memory channel. The frequency stored (if any) on the
current memory channel will be shown in the display.
Rotate the MEM/VFO CH knob to select the channel num-
ber on which you wish to store the current frequency data.
4. Press and hold in the [A](MW) key for one second until
you hear a double beep; the second beep confirms that
the frequency information was successfully stored.
Split-Frequency Memory Storage
You can also store "Split" frequencies, such as when operat-
ing on a repeater system not utilizing a "standard" offset. This
procedure may also be used for DX work on 7 MHz SSB, etc.
1. In the VFO mode, set the desired Receive frequency and mode.
2. Press the [F] key momentarily, then rotate the MEM/
VFO CH knob, as needed, until Multi Function Row
"b" [MW, SKIP, TAG] appears on the display.
3. Press the [A](MW) key momentarily to enter the
"Memory Check" mode, which is used to find an unused
memory channel. The frequency stored (if any) on the
current memory channel will be shown in the display.
Rotate the MEM/VFO CH knob to select the channel on
which you wish to store the receive frequency data.
4. Press and hold in the [A](MW) key for one second until
you hear a double beep, which confirms that the Receive
frequency data is now stored.
5. Now, set the desired Transmit frequency and mode on the VFO.
6. Press the [A](MW) key momentarily; do not rotate the
MEM/VFO CH knob!
While the "memory channel number" is blinking, press
and hold in the PTT switch; while holding it in, press
and hold in the [A](MW) key for one second.
The double "beep" will confirm that independent Trans-
mit frequency data is now stored. You may now release
the PTT switch.

Memory Channel Recall
1. If you currently are in the VFO tuning mode, press the V/M key once to enter the "Memory" mode (a memory channel number "M-nnn" will appear on the display in the space previously occupied by "VFOa" or "VFOb").
2. To select another memory channel, turn the MEM/VFO CH knob.
3. When your memory channels are partitioned into Memory Groups via Menu Mode No-055 [MEM GROUP], it is easy to change Memory Groups; press the MEM/VFO CH knob momentarily (a Group Number ("Ma" ~ "Mj") will blink), then turn the MEM/VFO CH knob to step through the channels until you enter another. You may now press the MEM/VFO CH knob once more to restrict memory channel access to the newly-selected Group.
4. Once you are operating on a memory channel, you may tune off of the originally-memorized frequency (as though you were in the VFO mode). Just rotate the DIAL knob; the "Memory Channel Number" will be replaced by one which indicates "MTUNE," indicating that you have now shifted into the "Memory Tuning" mode. When operating the Memory Tuning mode, if you find another frequency you wish to store into another memory channel, just press the [A](MW) key momentarily, select a new memory channel via the MEM/VFO CH knob, then press and hold in the [A](MW) key until you hear the double beep.
5. To exit the Memory Tuning mode, press the V/M key as follows:
· One touch of the V/M key returns you to the original memory frequency.
· A second touch of the V/M key will cause you to exit the Memory mode and return to the VFO mode (the memory channel number will be replaced by "VFOa" or "VFOb".

Our local EmComm group has some 'cheatsheets' for various ham radios on the website of the group. I put my cheatsheets for the FT-897 and VX-5r up on the website from entering the freq to assigning an alpha nametag. Go to http://www.specsnet.org

My apologies and I hope you find your answer but this is sooo begging for an answer like - "The position needs to be, seated (or standing whatever your preference) and the front of the radio with your hand
rotating your frequency knob."

Seriously..
I believe you might be referring to the TEN settings - I'd suggest you download the manual and follow an example in that.

I may have the pdf somewhere, but the printed version is better to read away from the computer by your radio and try
settings.

God luck

Hi Guys,
I added a couple of files on fixing the FP-30 Switching noise problem.
I had been discussing this on this 897 site with some other Hams and couldn't find the original paperwork from Yaesu till today.

It should be noted this applies to the original FP-30 not the FP-30B that incorporates the fix.

27181. Ameritron Amplifier And FT897

Yahoo group: FT897 (2009)
Date: 2009-08-08 13:32:45 UTC
From: Noel Zeibari
Topic: 27181 Message: 27181

Hi

My AL-811H amplifier is working fine with my other two Kenwood rigs.
Got an Audio Y-Cable from R/S with a 1/8" stereo male to Dual RCA Phono male and hooked it up. So far no matter what I tried, can't get the Amplifier to work.
The Tip is hooked up to ALC and the Ring is hooked up to the Relay.

Searched the archives, could not find anything relating to my problem.
My CT-62 Cat cable is hooked to com 7 on the computer.
I would appreciate if some one have the same setup could help me.

73, Noel (OM) N3NZ
